SUPPLEMENTARY INFORMATION:

I. Introduction

The U.S. Nuclear Regulatory Commission (NRC) is considering the issuance of a license amendment to terminate Material License No. 24-17152-02 issued to Maxim Technologies, Inc. (the licensee). The license amendment will approve the licensee's St. Louis, Missouri facility for unrestricted use.

The NRC staff prepared an Environmental Assessment in support of this license action in accordance with the requirements of Title 10, Code of Federal Regulations Part 51, "Environmental Protection Regulations for Domestic Licensing and Related Regulatory Functions." Based on the Environmental Assessment, the NRC concluded that a Finding of No Significant Impact is appropriate. The amendment will be issued following the publication of this Notice.

II. EA Summary

The purpose of the proposed amendment is to terminate the licensee's byproduct material license and release its St. Louis, Missouri facility for unrestricted use. On October 14, 1983, the NRC authorized the licensee to conduct radiochemical analysis of environmental samples at the facility located at 12161 Lackland Road, St. Louis, Missouri. On April 17, 1989, the NRC authorized the unrestricted release of the 12161 Lackland Road, St. Louis, Missouri facility for unrestricted use and approved the licensee's current facility located at 1908 Innerbelt Business Center Drive, St. Louis, Missouri. On November 17, 2004, Maxim Technologies, Inc. submitted a license amendment requesting termination of its license and requesting release of its facility for unrestricted use. The licensee conducted surveys of the facility and provided information to the NRC to demonstrate that the site meets the license termination criteria in 10 CFR part 20, subpart E, "Radiological Criteria for License Termination," for unrestricted release. The NRC staff examined the licensee's request and the information provided in support of its request, including the surveys performed to demonstrate compliance with 10 CFR 20.1402, "Radiological Criteria for Unrestricted Use," to ensure

that the NRC's decision is protective of the public health and safety and the environment.

III. Finding of No Significant Impact

On the basis of the Environmental Assessment, NRC concluded that there are no significant environmental impacts from the proposed amendment and determined not to prepare an environmental impact statement.

SUPPLEMENTARY INFORMATION:

Draft Report Entitled, "Station Blackout Risk Evaluation for Nuclear Power Plants"

This report is an update of several previous reports analyzing the risk from loss of offsite power and subsequent station blackout events at U.S. commercial nuclear power plants. The risk measure used is core damage frequency. Standardized plant analysis risk (SPAR) models developed by the U.S. Nuclear Regulatory Commission, covering the 103 operating commercial nuclear power plants, were used to evaluate the risk. Core damage frequency results indicating contributions from station blackout scenarios and other loss of offsite power scenarios are presented for each of the 103 plants, along with plant class and industry averages. In addition, a comprehensive review of emergency

diesel generator performance was performed to obtain current estimates for input to the SPAR models. Overall results indicate that core damage frequencies for loss of offsite power and station blackout are lower than previous estimates. Contributing to this risk reduction is an improvement in emergency diesel generator performance.
