**Title:** Detroit Children's Health Study: Health Effects of Environmental Exposures among Children Living in the Detroit, Michigan Area.

**Abstract:** This epidemiologic study will be conducted by EPA's National Health and Environmental Effects Research Laboratory. This study will examine the role of long-term environmental exposures, particularly local sources of ambient air pollution, in children's respiratory health conditions such as allergies and asthma. The participation of parents and children in this collection of information is strictly voluntary.

Children's respiratory health will be assessed by a parent-completed questionnaire and by simple measures of the child's lung function and exhaled breath. The twenty-page questionnaire will be distributed to the parents of children enrolled in the fourth and fifth grades at selected public schools in Detroit and Dearborn. The questionnaire includes a request for permission for their child to participate in measurements of lung parameters. Later, at a subset of these schools, those children with parental consent will be asked to perform simple measurements of air flow rates, lung volumes, and exhaled nitric oxide. The schools will be selected based on school location with respect to major roadways and major emission point sources.

Children's long-term environmental exposures will be assessed based on a detailed lifetime residential history from the questionnaire, supplemental air quality measurements collected at a selected group of schools distributed throughout the school district, and an air quality model incorporating geographic information on local sources of air pollutants. Central site measurements of ambient air pollutants will be collected at the time of the lung function examinations.

The collected information will be used to estimate the epidemiologic
