SUPPLEMENTARY INFORMATION: The INTEC TFF and TFF system consists of eleven 300,000-gallon belowgrade stainless-steel tanks in unlined concrete vaults, four 30,000-gallon belowgrade stainless-steel tanks, and associated ancillary equipment and piping. Historically, the TFF tanks were used to store various INTEC wastes, including those from reprocessing spent nuclear fuel, decontamination waste, laboratory waste, and contaminated liquids from other INTEC operations. DOE has initiated cleaning of the TFF and TFF system, a process that includes consolidating remaining wastes in the minimum number of tanks necessary, and then cleaning the empty tanks and ancillary equipment and piping. After completing cleaning operations, a small amount of residual radioactive waste that cannot be removed will remain in the tanks and ancillary equipment and piping. DOE plans to stabilize the residuals by filling the TFF and TFF system with grout. The Secretary's Section 3116 Determination concludes that the TFF and TFF system residuals

will meet the criteria in NDAA Section 3116. Therefore, and pursuant to Section 3116, that material is not HLW. The Basis Document sets forth the reasons supporting the Section 3116 Determination. DOE's Amended Record of Decision to close the TFF pursuant to the *Idaho High-Level Waste and Facilities Disposition Final Environmental Impact Statement* (DOE/EIS-0287, September 2002) is being provided separately and concurrently with this notice.

Issued in Washington, DC, on November 20, 2006.
