

survey questionnaire booklet or an Internet web-based survey questionnaire.

The ultimate goal of the study is to provide surveillance data that will help to minimize and prevent work-related

injuries and illnesses that harm miners and reduce productivity. NIOSH will use the information to calculate injury rates and customize safety and health interventions for various mining occupations. Once the study is

completed, NIOSH will send a copy of the final report to each sampled mining operation. There is no cost to respondents other than their time. The total estimated annualized burden hours are 3,296.

**Proposed Project**

A sustainability Assessment of Community-based Interventions in Northwestern Tanzania—New—National Center for Chronic Disease Prevention and Health Promotion

(NCDDPHP), Centers for Disease Control and Prevention (CDC).

*Background and Brief Description*

Empowerment and capacity building have been promoted by the Bamako Initiative as integral steps in making Primary Health Care (PHC) services universally available. These Health Sector Reform programs have built on the Bamako Initiative since the early 1990s, drawing attention to the potential for community engagement in health services and health governance through mechanisms such as Community Health Funds. In many contexts, community-focused approaches have been used to promote maternal and infant health, and community well-being.

In Tanzania, a community-based approach to improve maternal and newborn health (MNH) and reduce preventable maternal and perinatal deaths was implemented by CARE with CDC technical support from 1997-2002, called the Community Based Reproductive Health Program (CBRHP). This approach used a community-based surveillance system to identify preventable deaths during pregnancy, during the perinatal and newborn period, and developed a community mobilization program utilizing community volunteers to assist women and families with obstetrical emergencies to get to functioning health facilities. Specifically the initiative focused on increasing capacity for community members to identify and

participate in decisions and strategies for providing health care services, and supporting prevention and health education through village health workers (VHWs).

Evaluation of this effort showed that the community members used the services successfully and supported their volunteers, but only a handful of these communities had programs in place that were functional at the end of the project in 2002.

Since the end of project activities, the long-term sustainability of community-level efforts has not been assessed. Funds were obtained from the CDC-Georgia State University Initiative to conduct a sustainability assessment. Assessment of sustainability is critical for promoting community mobilization within the health care sector in resource poor settings such as northwestern Tanzania and places where CARE and other organizations work. Little data exist on the issue of long-term viability of community efforts and this project has the potential to inform the discussion about sustainability of health-focused programs.

The project staff at CDC is seeking to implement data collection for this project in Northwestern Tanzania to examine long-term sustainability of community-based efforts.

There are no costs to the respondents other than their time. The total estimated annualized burden hours are 267.
