SUPPLEMENTARY INFORMATION: The above-mentioned patent applications describe the human protein Brother of Regulator of Imprinted Sites ("BORIS"), and a method of detecting cancer by monitoring BORIS expression or by detecting anti-BORIS antibodies. Dr. Victor V. Lobanenkov and colleagues at the National Institute of Allergy and Infectious Diseases discovered BORIS and its potential application as a cancer diagnostic. BORIS is a paralog of CCCTC-binding factor ("CTCF"), a transcription factor that also functions in chromatin insulation. The amino acid sequences of BORIS and CTCF contain eleven conserved zinc fingers each of which binds to DNA. BORIS protein can be detected in cancer cells, and importantly, it is one of a few cancer-testis antigens that are immunogenic in humans.

BORIS resides in 20q13.2, a region that is commonly amplified in many human cancers. Normally, BORIS mRNA can be detected in testis, but not in other human tissues. However, BORIS mRNA is detectable in over one hundred cancer cell lines representing most of the major forms of human tumors and is also detectable in primary breast cancer tumor samples, but not in controls. BORIS protein is mis-expressed in cancer cell lines, and antibodies against BORIS have been detected in serum from patients with
