phosphorus. The purpose of this project is to develop a scientifically robust watershed model to determine the reductions in phosphorus loads that are needed to meet water quality standards in both States. This watershed model will serve as a tool to effectively identify nutrient reductions needed to ensure that water quality standards for phosphorus are protected in both States; and, to devise varying allocation and load reductions scenarios needed to guide appropriate point and non-point source controls.

Specifically, EPA is soliciting technical information on measurements of nutrients and related constituents in surface waters, and all associated information needed to support development of the Illinois River Watershed model and one or more planned TMDLs. Examples of data requested include:

1. Monitoring data of nutrients, sediment, flow, water temperature, dissolved oxygen and organics (oxygen demand) for any locations within the Illinois River watershed, including the main-stem, its tributaries and other water-bodies.

2. Watershed land use/land cover characteristics, including topography, hydrography, drainage patterns, soils, cropping patterns, and other potential nutrient sources. GIS (geographic information system) coverage is preferred for this type of spatial data.

3. Precipitation and meteorological data, including evaporation, air temperature, wind movement, solar radiation, dew-point temperature, and cloud cover. Daily data for the 1980–2010 time periods is needed. Precipitation data at shorter time intervals, (e.g., hourly or 15-minute) is needed for some locations to provide adequate coverage and definition of rainfall patterns across the watershed.

4. Hydrography and geomorphological data for channels and major water-bodies, including channel lengths and slopes, cross-sections and geometry, bed composition (sediment particle sizes, nutrients), stage/storage/surface area information, etc. Prior flood insurance and associated modeling studies would be useful.

5. Other nutrient source information and/or water quality assessments specifically addressing wastewater discharges, agricultural water diversions and/or agricultural return flows, water supply intake structures, and information regarding the distribution, population and locations of feedlots, pastures, cattle and poultry houses.

6. Prior investigations and modeling studies that analyze monitoring data, describe agronomic and poultry

practices, estimate nonpoint source loading rates for nutrients by source category, assess water quality impacts and/or biotic endpoints for any sites within the watershed.
