SUPPLEMENTARY INFORMATION:

Background

The GPS satellite SVN 49 has a unique signal that may result in degraded performance for some GPS user equipment. This satellite currently operates with the navigational message set in an unhealthy state to prevent any adverse impact to users. To minimize the adverse impacts, several mitigations are under consideration. Each mitigation is intended for a specific user group and can be used with or without the other mitigations. All mitigations are intended for use with SVN 49 only and no changes will be made regarding other GPS satellites. The mitigations are briefly described as:

- Set SVN 49 healthy with current 152m Antenna Phase Center (APC) and associated clock offsets.
- Set SVN 49 healthy with factory default APC and clock offset.
- Users switch to multipath-resistant receivers to minimize adverse impact from SVN 49 signal.
- Modify receiver software to use look-up table corrections to account for unique SVN 49 signal.
- Increase SVN 49 User Range Accuracy (URA) minimum value to 3 by changing bits in the GPS data message that allow user equipment to de-weight or exclude SVN-49 signals.

- Remove data modulation from L2 P(Y)-code to mitigate impact to high precision users.

- Change L2C PRN code to a "unique sequence" to prevent L2C users from including SVN 49 in their solutions.

- Change SVN-49 from PRN-01 to PRN-32 to prevent updates to WAGE users.

- Use spare health code so future users could use SVN 49 despite unhealthy setting.

More information is presented in the Appendix posted in the public docket. Implementation of each mitigation is contingent upon several factors including cost, number of users impacted, schedule, and the needs of the U.S. Government. If you would like to submit a public comment concerning these proposed actions, please follow the instructions listed above.

Issued in Washington, DC, on March 22, 2010.

Deputy Administrator.
