

A study of the value of ecological restoration is of particular interest in this location because significant baseline ecological data are available to allow a comparison of ecological values with some of the more obvious use losses associated with the reservoir.

The ability to link results of the study to precise measures of ecosystem changes will be useful in applying the study to future restoration sites, enabling NOAA to evaluate a broader range of ecosystem services provided by future restoration actions.

A nonmarket valuation survey of the U.S. public and members of the Lower Elwha Klallam Tribe will be developed and implemented. To ensure the survey questions and policy scenarios presented in this survey are accurate, easily understood, and the least burdensome, it is important to test the survey with small focus groups and in one-on-one interviews.

II. Method of Collection

Information will be collected through 12 focus groups, 2 stakeholder meetings and 24 one-on-one interviews.
