

revegetation activities, while larger equipment would be employed for excavation of large debris deposits and reconfiguration of the Colorado River through the Lulu City wetland. This alternative would include stabilization of zone 1A under the preferred option, option 1. Alternative E, maximum restoration, would involve extensive management activity and use of motorized equipment over large portions of the impacted area to restore the damage. Engineered solutions would be used to stabilize banks and slopes to approximate pre-breach contours and to reduce transport of sediments over a larger portion of the impacted area. Extensive changes would be made to the Colorado River channel to route the river to its historical alignment through the center of the Lulu City wetland. To facilitate movement of heavy mechanized equipment and excavated debris from the wetland to upland disposal areas, a temporary haul road would be constructed. This alternative would include stabilization of zone 1A under one of two stabilization options. All action alternatives would have substantial beneficial impacts to wilderness character; surface and groundwater hydrology; stream channel, floodplain and wetland morphology and function; water quality; riparian and wetland communities; aquatic habitat; visitor experience; and long-term resource productivity.
