

after a major storm? Do providers provide appropriate urgency to handling such outages?

To what extent is the availability of multiple access platforms (e.g., residential telephone line, whether legacy or IP-based, cell phone, etc.) to reach networks services creating greater richness of diversity that would tend to improve 9–1–1 reliability? Stated differently, to what extent does the public have more than one way to reach 9–1–1 that are not reliant on each other? To what extent are available access platforms reliant on each other or another common point of failure?

The legacy communications network uses a hierarchical architecture, whereby failures of network elements located deeper in the network will result in a larger number of customers being denied network service. For this reason, elements deeper in the network (e.g., switches) were often designed to very high reliability specifications. To what extent has the legacy infrastructure retained this characteristic? Today's networks are quickly migrating to broadband IP technology. To what extent does the migration to IP-based networks reduce or increase the level of concentration deeper in the network? What is the resultant impact on communications reliability?

What other steps might service providers take? What actions should PSAPs take? What other actions, if any, should the Commission take to encourage those steps? What actions should the public and other institutions like hospitals take, if any? We seek comment on whether the deployment of Next Generation (NG911) will improve the reliability of 9–1–1 services and, if so, how? Would NG911 make it easier to have more than one backup PSAP and provide additional redundancy of transmission facilities, e.g., via satellite or microwave point-to-point links? Did commercial data centers in the affected areas experience outages and for how long? Would it increase reliability if critical components of the NG911 system are housed or replicated in commercial data centers?

NG911 will create the ability to utilize a "virtual PSAP." Today's 9–1–1 system generally requires a call taker to answer a 9–1–1 call from within the walls of a single physical ("brick and mortar") PSAP. In a NG911 network, however, a call taker will be able to answer a 9–1–1 call from virtually any location. The FCC seeks comment on the potential for development of virtual PSAPs. Are current technologies sufficient to support virtual PSAPs? Are there specific steps that service providers should take to ensure that they have

adequate reliability when implementing NG9–1–1? How would the addition of a 9–1–1 text capability provide substantial improvement in the ability of consumers to contact PSAPs?
