

Simulation results illustrate a high degree of variability in the response of different streamflow and water quality attributes to climate change throughout the nation. Results also illustrate sensitivity to methodological choices such as different approaches for downscaling global climate change simulations and use of different watershed models. This understanding may lead to improvements in how existing models and datasets can be used to assess climate change impacts on watersheds.

This report presents a summary of simulation results. The report is technical in nature but results are of broad interest to water and watershed managers, urban or regional planners, government officials, and scientists and engineers interested in the potential implications of climate change on streamflow and water quality in different regions of the nation.
