

show total power over the measurement bandwidth. If the resolution bandwidth is approximately equal to the measurement bandwidth, and much less than the emission bandwidth of the equipment under test, the measured results shall be corrected to account for any difference between the resolution bandwidth of the test instrument and its actual noise bandwidth.

(6) The ratio of the maximum peak excursion of the modulation envelope (measured in a 1 MHz bandwidth using a peak hold function) to the maximum power spectral density during an interval of continuous transmission (measured in a 1 MHz bandwidth) shall not exceed 13 dB. Each of the two maxima shall be separately determined across the full emission bandwidth. If the emission bandwidth is less than 1 MHz, the measurement may be performed in a resolution bandwidth narrower than 1 MHz but wider than or equal to the emission bandwidth.

(4) For transmitters operating in the 5.725–5.850 GHz band: all emissions within the frequency range from the band edge to 10 MHz above or below the band edge shall not exceed an e.i.r.p. of –17 dBm/MHz; for frequencies 10 MHz or greater above or below the band edge, emissions shall not exceed an e.i.r.p. of –27 dBm/MHz.

(f) Within the 5.725–5.85 GHz band, the minimum 6 dB bandwidth of U–NII devices shall be at least 500 kHz.

(j) All U–NII Devices must contain security features to protect against modification of software by unauthorized parties.
