

substances and mixtures currently in use and the existing available information regarding potential health effects. EPA understands that mixtures can change frequently in hydraulic fracturing operations, and in the E&P industry more broadly, and the petition does not provide sufficient information to enable EPA to effectively identify what mixtures, or classes of mixtures, if any, might most efficiently be tested. Any existing mixture tested might not still be in use once testing has been completed, and additional mixtures might be in use at that point. A requirement to test certain representative mixtures might be reasonable and more efficient than testing individual chemical substances, but petitioners did not provide sufficient information to support such a finding.

EPA is in the process of evaluating information in its possession and plans to request additional information as described in this document. While EPA agrees with petitioners that the Office of Research and Development (ORD) study focuses on the potential impacts on drinking water resources and does not require companies to conduct testing or to develop health and safety data, EPA plans to summarize the available data (including data the Agency may already have collected) on the toxicity of chemical substances and mixtures used in hydraulic fracturing, and to identify and prioritize data gaps for further investigation. This information will aid in EPA's understanding of potential effects beyond drinking water impacts. EPA also plans to review the results from the Agency's other activities and those from other Federal agencies (Ref. 3).
