

injected intrathecally in wild-type and Nppb^{-/-} mice. Itch responses were blocked by toxin-mediated ablation of Nppb-receptor-expressing cells, but a second neuropeptide, gastrin-releasing peptide, still induced strong responses in the toxin-treated animals.

Potential Commercial Applications:

- Therapeutics for preventing or treating pruritis/itching.
- Screening of novel Nppb blocking agents.

Competitive Advantages: A new mode of treating itch and itch induced conditions using selective Nppb antagonists.

Development Stage:

- Early-stage
- In vitro data available

Recombinant Stabilized Prefusion Protein of Respiratory Syncytial Virus for Use as a Subunit Vaccine

Description of Technology: The invention, a stabilized recombinant prefusion F protein (pre F), is a candidate subunit vaccine for Respiratory Syncytial Virus (RSV). Pre-F is stabilized in the prefusion conformation and displays epitopes not present in postfusion F protein. Several potent RSV neutralizing antibodies bind pre F, but not postfusion F. Therefore, immunization with pre F may elicit an immune response superior to the response generated by postfusion F.

NIH researchers have engineered pre F to expose an antigenic site 0, which is targeted by extremely potent RSV neutralizing antibodies. Structure-based design yielded several stabilized variants of pre F that maintained exposure of antigenic site 0 when subjected to extremes of pH, osmolality and temperature.

Preclinical in vivo data on stabilized pre F is available. Immunization of mice and macaques with antigenic site 0 stabilized pre F variants elicited high levels of RSV specific neutralizing activity.

Potential Commercial Applications:

Vaccine for Respiratory Syncytial Virus

Competitive Advantages:

- Vaccine stably exposes antigenic site in RSV F that permits generation of potent RSV neutralizing antibodies.

- There is currently no RSV vaccine on the market.

Development Stage:

- Pre-clinical
- In vivo data available (animal)
