k. This application has been accepted, and is ready for environmental analysis at this time.

l. *Project Description:* The existing Chasm Project consists of: (1) a 201-foot-long, 32-foot-high maximum height concrete gravity-type dam having a spillway section with crest elevation 1,283.8 feet mean sea level (msl) about 100 feet long, surmounted by 2-foot-high flashboards and having an intake section with steel trash racks and headgates; (2) a reservoir having a surface area of about 22 acres and a gross storage capacity of 74 acre-feet at normal pool elevation of 1,285.8 feet msl; (3) a 7-foot-diameter welded steel pipeline approximately 3,355 feet in length connecting to a 6-foot-diameter steel manifold pipeline just upstream of the powerhouse; (4) a powerhouse containing three Francis-type generating units having a total rated capacity of 3,350 kilowatts operated under a 268-foot head and at a flow of 195 cubic feet per second (cfs); (5) a 20-foot-wide, 850-foot-long tailrace; (6) three 2.2-kilovolt generator leads extending from the powerhouse about 74 feet to an adjacent switchyard; (7) a 4.2-megavolt-ampere step-up transformer located within the switchyard, connecting to a transmission line owned and operated by the National Grid Corporation; and (8) appurtenant facilities.

Erie proposes a minimum flow of 15 cfs into the bypassed reach at all times and would forego its existing ability to lower the minimum bypass flow to 10 cfs when inflow is less than 85 cfs. In addition, Erie proposes to maintain the impoundment elevation within 0.1 foot of the spillway crest (or flashboards, when installed) when inflow is less than 85 cfs and 0.25 foot when inflow is greater than 85 cfs.
