

Administration posted a chart of the "Average Age of Automobiles and Trucks in Use, 1970–1999" that indicates the average vehicle age in 1970 was 5.6 years. (this information was compiled from Polk Company data by Ward's Communications, Ward's Motor Vehicle Facts and Figures from 2001) By 2013, Polk posted that the average vehicle age that year was 11.4 years. (see https://www.polk.com/company/news/polk_finds_average_age_of_light_vehicles_continues_to_rise) At the time that the bulb outage indication requirement became part of the FMVSS 108, SAE J573d DEC68 listed the average turn signal bulb laboratory life as approximately 500 hours. Comparing that to the GM specified bulb life of 1100 hours yields a similar doubling of bulb life compared to the increase in the average vehicle age. Therefore, while the bulb life has indeed increased, it has increased at a rate similar to the average vehicle age which mathematically makes a bulb failure, when compared to vehicle life, the same likelihood now as it was in 1970.

Additionally, GM did not make any mention of the actual voltage that the electrical systems of the vehicles in question would be providing to the front turn signal bulbs. Factors such as voltage, heat, vibration and corrosion are all important things to consider that can have a significant effect on the life of a bulb and no consideration was given to these factors in GM's petition. For instance, GM technical bulletin 04–08–42–002 indicated that for certain vehicles, (2003–2004 Saturn ION) the "amount of voltage supplied to the front headlamp assembly for the turn signal circuit may cause the bulb to prematurely wear out."

Other turn signal lamp failure modes exist as well. For example, GM recall 06V–263 (2004–2005 Cadillac XLR) described premature bulb failure due to "vibration within a loose fitting socket or air entering the bulb due to an inadequate seal." Also, GM recalls 04V–547 (2003–2004 Saturn ION) and 04V–524 (2003 Chevrolet Cavalier and Pontiac Sunfire), described turn signal lamp failure due to "loss of" and "inadequate" "contact between the bulb and socket."

As such, NHTSA believes that there are many light source related failure modes that can cause a turn signal lamp to fail, and GM's argument that a light source failure is extremely unlikely based on laboratory bulb life does not adequately consider these other failure modes.

Third, Fourth, and Fifth, GM offers several scenarios regarding the

photometric performance of the turn signal lamp in the event that a single light source were to fail. Each one of GM's scenarios relies on downgrading the performance of the original equipment turn signal lamp from a large, two lighted section lamp, down to a smaller, one lighted section lamp. This results in a photometric performance requirement reduction of ~15% in the zones, as well as similar reductions at the individual test points. Even under the requirements assumed by GM for its scenarios, 75% of GM's scenarios still fail to meet even the reduced requirements.

GM argues that despite the failure of the lamps in these scenarios to meet the photometric requirements at some of the zones, it was within 25% of the minimum zonal requirements. When referring to these zonal failures, and within "25%" of the zonal requirements, it appears that GM is making a just noticeable difference (JND) argument relative to the zones. A NHTSA study titled "Driver Perception of Just Noticeable Differences of Automotive Signal Lamp Intensities" [DOT HS 808 209, September 1994] demonstrated that a change in luminous intensity of 25 percent or less is not noticeable by most drivers. However, NHTSA has stated that it is not valid to use the JND justification for judging the effect of zonal intensity failures. Drivers do not look at zones when they observe lamps; they look at the lamp from very narrow angles based on the distance between their eyes and the distance to the lamp. Using the JND justification on zones would imply that drivers would be looking at lamps from all the test points in the zone simultaneously and somehow integrating the numerous intensities into some false representation of how intense the lamp should be. This is simply not the case. For this reason, the JND argument is not applicable to zone failures. (see 62FR63417)

VII. Prior Inconsequentiality Petitions: NHTSA found one prior inconsequentiality determination regarding the turn signal bulb outage requirements of FMVSS No. 108. In 1999, General Motors determined that it had manufactured 209 Chevrolet S10 Electric Trucks that were non-compliant with the requirement. The agency granted GM's petition on the basis that these low volume trucks were mainly used in fleets and that they would receive regular periodic maintenance where detection of the failure of a turn signal lamp and replacement thereof would be more likely than in privately owned vehicles. As such, NHTSA felt that the likelihood of these low volume

trucks having any sustained period of outage would be a relatively infrequent event. (see 64 FR 44575) In contrast, the current situation involves 109,563 Chevrolet Malibu and Buick Regal passenger cars which are likely to be privately owned vehicles. Considering that a partial failure may go unnoticed by the vehicle owner, NHTSA believes that the likelihood of a sustained period of reduced turn signal performance due to an outage would be high.

VIII. Decision: In consideration of the foregoing, NHTSA has decided that GM has not met its burden of persuasion that the FMVSS No. 108 noncompliance described is inconsequential to motor vehicle safety. Accordingly, GM's petition is hereby denied, and GM is obligated to provide notification of, and a remedy for, that noncompliance under 49 U.S.C. 30118 and 30120.
