FDA's burden estimate is based on prior experience with research that is similar to this proposed study. Screening potential participants for the 2 pretests will occur with 762 respondents (487 adults and 275 adolescents) identified and recruited through the Internet panel. This brief screening will take an average of 2 minutes (0.033 hours) per respondent. Each of the 2 pretests will consist of 50 respondents (34 adults and 16 adolescents) conducted during a single session and take an average of 15 minutes (0.25 hours) per respondent. Screening potential participants for the main data collection will occur with 19,082 respondents (11,925 adults and 7,157 adolescents) identified and recruited through the same Internet panel as used for the pretests. This brief screening will take an average of 2 minutes (0.033 hours) per respondent. Recent national estimates of the numbers of adolescent current cigarette smokers, adolescents who are susceptible to initiation of cigarette smoking, young adult current cigarette smokers, and older adult current cigarette smokers informed the estimates of 13.9 percent qualification rate for adults and 11.6 percent qualification rate for adolescents. Applying these estimates and other assumptions from previous experience conducting similar studies to the number of adolescents and adults to be screened results in the desired sample size for the main data collection of 2,500 participants, of which 1,667 will be adults and 833 will be adolescents. The main data collection will occur with those 2,500 respondents during a single session. The main data collection will take an average of 15 minutes (0.25 hours) per respondent. The total estimated burden is 1,305 hours (25 hours + 25 hours + 630 hours + 625 hours).
