SUPPLEMENTARY INFORMATION: Animal drug sponsors are required to report annually to FDA the amount of antimicrobials sold or distributed for use in food-producing animals and provide species-specific estimates of the percentage of their drug product sales for use in any of the four major foodproducing species (cattle, swine, chickens, and turkeys) identified on the approved product label (21 CFR) 514.87(c)). FDA is announcing the availability of a proposed method for using a biomass denominator to adjust these sales data. The proposed method will provide estimates of annual antimicrobial drug sales adjusted for the size of the animal population (the animal biomass of each such species) potentially being treated with those drugs. The adjusted estimates will provide insight into broad shifts in the amount of antimicrobials sold for use in food-producing animals and give the Agency a more nuanced view of why sales increase or decrease over time in a manner that is specific to U.S. animal production. Such analysis will also support our ongoing efforts to encourage the judicious use of antimicrobials in food-producing animals to help ensure the continued availability of safe and effective antimicrobials for animals and

Application of a biomass denominator to normalize antimicrobial sales data has been used internationally. In developing this proposal for applying a biomass denominator to antimicrobial sales data in the United States, FDA has considered methods being utilized and discussed in other countries. FDA's intent in publishing the proposed method is to initiate discussion with stakeholders on the biomass correction method FDA is considering, and to seek comment on the methodology and the utility of this type of data analysis.
