

high affinity for plasma albumin and has been used for a long time in clinical practice for determination of patient plasma volume. The current imaging agent is a truncated form of EB [NEB] and has the ability to bind albumin with high affinity. The agent is also conjugated to NOTA to enable in vivo labeling with ¹⁸F labeling by the formation of ¹⁸F-aluminum fluoride complex. The NOTA also facilitates radiometal labeling of NEB with either ⁶⁸Ga or ⁶⁴Cu. The resulting imaging agent does not affect the in vivo behavior of serum albumin such as circulation, extra-vascularization, and turn-over; thus the imaging results will reflect the distribution and metabolism of serum albumin accurately.

Potential Commercial Applications:

- Blood pool imaging.
- Lymphatic system imaging.

Development Stage:

- In vivo data available.
