SUPPLEMENTARY INFORMATION:**Scope of Problem**

Tobacco use is the leading cause of preventable disease, disability, and death in the United States.¹ The burden of death and disease from tobacco use in the United States is overwhelmingly caused by cigarettes and other combusted tobacco products; therefore, rapid elimination of their use will dramatically reduce this burden.¹

Cigarette smoking alone causes more than 480,000 deaths each year, including more than 41,000 secondhand smoke related deaths, and costs the country over \$300 billion annually in health care spending and lost productivity.¹ Cigarette smoking is causally linked to numerous types of cancer, respiratory and cardiovascular diseases, diabetes, eye disease, complications to pregnancy and reproduction, and compromises the immune system.

Prevent Initiation of Tobacco Use Among Youth and Young Adults

Any form of tobacco product use is unsafe for youth, irrespective of whether it is smoked, smokeless, or electronic. Since brain development continues through the early to mid-20s, the use of products containing nicotine, including e-cigarettes, can be harmful to youth and young adults. Specifically, the use of these products can disrupt the growth of brain circuits that control attention, learning, and susceptibility to addiction.³ In 2018, nearly 4.9 million United States middle and high school students currently used (≥1 day in past 30 days) at least one type of tobacco product, with e-cigarettes being the most commonly used tobacco product.⁴ Flavors are a major factor contributing to the use of these products among young people; 85% of youth e-cigarette users report using flavors.⁵ The use of e-cigarettes may also lead to future cigarette smoking among some youth.⁶ In addition to e-cigarettes, youth also use several other types of tobacco products, and disparities in use of these products exist across population groups.¹⁴
