SUPPLEMENTARY INFORMATION:

Technology description follows.

Resolution Enhancement for Light Sheet Microscopy Systems and Methods

Available for licensing and commercial development is a system and technique for enhancing the resolution of images acquired through light sheet microscopy by adding additional enhanced depth-of-focus optical arrangements and high numerical aperture objective lenses. The technique employs an arrangement of three objective lenses and a processor for combining captured images. The first objective lens illuminates the sample and the second and third objective lenses collect the fluorescence emissions emitted by the sample. The second objective lens focuses a first portion of the fluorescence emissions for detection by a second detection component. The third objective lens focuses a second portion of the fluorescence emissions through a diffractive or refractive optic component. A processor combines the images resulting from first and second portions of the fluorescence emissions and generates a composite image with improved axial and lateral resolution.

Potential Commercial Applications:

- High speed imaging
- Fast single cell and cellular dynamics imaging

- Super-resolution and single molecule imaging
- 3D single particle tracking
- 3D super-resolution imaging in thick samples

Competitive Advantages:

- Resolution enhancement in light microscopy

Development Stage:

- In vitro data available
