n. *The proposed project would consist of the following new facilities*: (1) A 61-

acre upper reservoir formed by a 175-foot high, 8,000 foot-long rockfill embankment dam at an elevation of 2,950 feet mean sea level (MSL) with a vertical concrete intake-outlet structure; (2) a 63-acre lower reservoir formed by a 205-foot high, 6,100-foot long embankment at an elevation of 590 feet MSL with a horizontal concrete intake-outlet structure and vertical steel slide gates; (3) an underground conveyance tunnel system connecting the two reservoirs consisting of a 2,200-foot-long, 29-foot diameter concrete-lined vertical shaft, a 3,300-foot-long, 29-foot diameter concrete-lined high pressure tunnel, a 200-foot-long, 22-foot diameter high pressure manifold tunnel, three 600-foot-long, 15-foot diameter steel/concrete penstocks, a 200-foot-long, 20-foot diameter steel-lined draft tube tunnel, a 200-foot-long, 26-foot diameter concrete-lined low pressure tunnel, and a 3,200-foot-long, 30-foot diameter concrete-lined tailrace tunnel; (4) an underground powerhouse located between the upper and lower reservoir in a 0.83-acre powerhouse cavern containing three, 400-megawatt (MW) Francis-type pump-turbine units for a total installed capacity of 1,200 MW; (5) a 0.48-acre underground transformer cavern adjacent to the powerhouse containing intermediate step-up transformers that will step up the voltage to 115 kilovolts; (6) two 30-foot diameter tunnels for accessing the powerhouse and transformer caverns; (7) an approximate 1.0-mile-long, 115-kilovolt transmission line routed from the transformer gallery through the combined access/transmission tunnel to a new outdoor 7.3-acre substation/switchyard that will step up the voltage to 500 kilovolts; (8) a 4-mile-long, 500-kilovolt transmission line routed from the substation/switchyard south over the Columbia River and connecting to Bonneville Power Administration's existing John Day Substation; (9) a buried 2.5-foot diameter water fill line leading from a shut-off and throttling valve within a non-project water supply vault owned by Klickitat Public Utility District (KPU) to an outlet structure within the lower reservoir to convey water for reservoir filling; and (10) appurtenant facilities. The project would also include an existing 0.7-mile road for accessing the lower reservoir site and an existing 8.6-mile road for accessing the upper reservoir site both of which may be modified to provide for construction vehicle access.

The water supply used to initially fill the lower reservoir as well as to provide make-up water would be purchased from KPU and would be sourced from

KPUD's existing intake pond on the Columbia River. The new project water fill line would connect to a new KPUD-owned flanged water supply service connection in a water supply vault located near the lower reservoir. Within the vault, and just downstream of the service connection, there would be a project shut-off and throttling valve to allow control of the initial fill and make-up water flow rate into the lower reservoir. The initial volume of water necessary to fill the lower reservoir is estimated to be 7,640 acre-feet and would be filled over about six months at an average flow rate of approximately 21 cubic feet per second (maximum flow rate available is 35 cubic feet per second). It is estimated that the project would need 260 acre-feet of water each year to replenish water lost through evaporation. The estimated annual generation for operating 8 hours a day, 7 days a week is 3,500 gigawatt-hours per year.
