SUPPLEMENTARY INFORMATION: Section 103(h) of the Federal Mine Safety and Health Act of 1977 (Mine Act), 30 U.S.C. 813(h), authorizes MSHA to collect information necessary to carry out its duty in protecting the safety and health of miners. Chronic exposure to respirable coal mine dust causes lung diseases including coal workers' pneumoconiosis (CWP), emphysema, silicosis, and chronic bronchitis, known collectively as "black lung." MSHA's standards in 30 CFR parts 70, 71, and 90 require each mine operator of an underground coal mine, surface coal mine, and surface work areas of an underground coal mine, and each coal mine operator who employs a part 90 miner, to protect miners from exposure to excessive respirable coal mine dust levels. Parts 70 and 71 require coal mine operators to continuously maintain the average concentration of respirable coal mine dust in the mine atmosphere where miners normally work or travel at or below 1.5 milligrams per cubic meter (mg/m³). For additional substantive information about this ICR, see the related notice published in the **Federal Register** on May 23, 2022 (87 FR 31261).
