

a few prime number generation routines in FIPS 186–5. Specifically, the bounds were changed in steps 4.7 and 5.8 of Appendix A.1.3, Generation of Random Primes that are Probably Prime, as well as in step 9 of Appendix B.9, Compute a Probably Prime Factor Based on Auxiliary Primes.

Response: NIST had observed that the original bounds led to higher probabilities of failure than desired when attempting to generate primes. The bounds were increased to decrease the probability of failure.

20. *Comment:* One commenter suggested simplifying the deterministic version of ECDSA.

Response: To remain consistent with RFC 6979, NIST will keep the deterministic version of ECDSA as currently specified.

21. *Comment:* One commenter recommended removing signature algorithms that are not deterministic.

Response: NIST believes that both deterministic and non-deterministic signature schemes serve important use cases and so will keep the specified algorithms as they are.

22. *Comment:* The removal of RSASSA-PKCS–v1.5 as an approved digital signature algorithm was recommended by one commenter.

Response: Due to its broad use in security protocols and products, FIPS 186–5 continues to approve the use of RSASSA-PKCS–v1.5, subject to the additional constraints specified in FIPS 186–5 to mitigate known security vulnerabilities.

23. *Comment:* Corrections were recommended for defining encodings for EdDSA.

Response: NIST accepted the corrections.

24. *Comment:* A correction in A.3.3 was recommended so that FIPS 186–5 matches RFC 6979 for the per-message secret number generation for deterministic ECDSA.

Response: NIST accepted the correction.

25. *Comment:* A few commenters suggested alternate algorithms in FIPS 186–5 to replace the reference algorithms provided by NIST for various computations. For example, commenters suggested alternatives to the square root algorithm for EdDSA in Section 7.3, the square checking algorithm in Appendix B.4, and the algorithm for inverting a finite field element in Appendix B.1.

Response: FIPS 186–5 includes language to clarify that alternate algorithms (including constant-time algorithms) that produce equivalent results may be used in place of the

reference algorithms provided in the FIPS.

26. *Comment:* A comment was submitted on a difference between EdDSA and the other signature schemes in FIPS 186–5. Namely, that revealing the hash of a private key for EdDSA is a security concern, while it is not for RSA or ECDSA.

Response: NIST does not believe the concern merits changing EdDSA, and will maintain consistency with RFC 6979. Furthermore, FIPS 186–5 forbids revealing the hash of the private key of any of the signature algorithms.
