Abstract: We propose to collect information to better understand public preferences for climate adaptation strategies in the Midwestern United States. We plan to survey up to 1,000 individual residents in each of the following eight states: Illinois, Indiana, Iowa, Michigan, Minnesota, Missouri, Ohio, and Wisconsin. The survey will gather information on people's perceptions of climate-change impacts, preferences for climate-adaptation strategies to address specific impacts, and whether the level of the respondent's support for adaptation strategies changes when they are

provided information about the outcomes of strategies. We will also collect sociodemographic and behavioral information, as well as other characteristics, from study participants to understand the factors that correlate with support for climate-adaptation strategies. This information will help us understand what social-psychological factors influence acceptability of climate adaptation strategies as well as how acceptability might be impacted by communication about the benefits of the strategies. Data will be collected using a web-based survey administered at the University of Minnesota. Participants will be randomly assigned to 4 different treatment or control surveys in which the benefits of the different climate-adaptation strategies will be framed differently. We are designing the study to understand how the framing of benefits from the strategies might influence support for the strategies. We will use information from this study to develop recommendations for engaging the public and stakeholders in developing climate-change adaptation management strategies.
