The project is operated as a seasonal storage reservoir as part of the Androscoggin River Storage System. The current license requires ARCO to provide a minimum flow of 130 cubic feet per second (cfs) downstream of the powerhouse from the start of spring refill through September 15. The minimum flow is increased to 214 cfs from September 16 to the start of spring refill each year. The current license requires that 50 cfs of the required minimum flow, be released from the Aziscohos Dam into the bypassed reach of the Magalloway River. The current license also requires that a whitewater flow of 900 cfs be released during the 4th weekend of June, 1st weekend of July, and 1st weekend of September; and a whitewater flow of 1,200 cfs be released on the 2nd weekend of July, and the 3rd and 4th weekend of August.

The minimum and maximum hydraulic capacities of the powerhouse are 290 cfs and 623 cfs, respectively. The average annual generation of the project was approximately 30,788 megawatt-hours from 2012 through 2022.

ARCO is not proposing any changes to project facilities or operation at this time.
