The measure assesses individuals on a 0-100 scale that converts to one of four levels of activation, from low (1) to high (4). The PAM® performance measure (PAM®-PM) is the change in score on the PAM® from baseline to follow-up measurement.	Insignia Health, LLC, a wholly owned subsidiary of Phreesia

B.12. Endocrinology

MEASURES FINALIZED FOR ADDITION TO THE ENDOCRINOLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendation s on current vaccination.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Endocrinology specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease. ¹⁰³⁵ Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations. ¹⁰³⁶ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.

We received no public comments on the measure(s) proposed for addition to this specialty set. For the reasons stated above and in the proposed rule (89 FR 62317), we are finalizing the above measure(s) for addition to the *Endocrinology Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

¹⁰³⁵ See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰³⁶ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

B.13. Family Medicine

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Family Medicine specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable.

(Outcome)	2483 / N/A	503	N/A	MIPS CQM Specifications	Patient-Reported Outcome-Based Performance Measure	Gains in Patient Activation Measure (PAM®) Scores at 12 Months: The Patient Activation Measure® (PAM®) is a 10 – or 13 – item questionnaire that assesses an individual’s knowledge, skills and confidence for managing their health and health care. The measure assesses individuals on a 0-100 scale that converts to one of four levels of activation, from low (1) to high (4). The PAM® performance measure (PAM®-PM) is the change in score on the PAM® from baseline to follow-up measurement.	Insignia Health, LLC, a wholly owned subsidiary of Phreesia
* ! (Safety)	N/A / N/A	504	N/A	MIPS CQM Specifications	Process	Initiation, Review, And/OR Update To Suicide Safety Plan For Individuals With Suicidal Thoughts, Behavior, Or Suicide Risk: Percentage of patients aged 12 years and older with suicidal ideation or behavior symptoms (based on results of a standardized assessment tool or screening tool) or increased suicide risk (based on the clinician's evaluation or clinician-rating tool) for whom a suicide safety plan is initiated, reviewed, and/or updated in collaboration between the patient and their clinician.	American Psychiatric Association
! (Outcome)	N/A / N/A	505	N/A	MIPS CQM Specifications	Patient-Reported Outcome-Based Performance Measure	Reduction in Suicidal Ideation or Behavior Symptoms: The percentage of patients aged 18 and older with a mental and/or substance use disorder AND suicidal thoughts, behaviors or risk symptoms who demonstrated a reduction in suicidal ideation and/or behavior symptoms based on results from the Columbia-Suicide Severity Rating Scale (C-SSRS) ‘Screen Version’ or ‘Since Last Visit’ within 120 days after an index assessment.	American Psychiatric Association

B.13. Family Medicine

MEASURES FINALIZED FOR ADDITION TO THE FAMILY MEDICINE SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	<p>Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.</p>	Centers for Medicare & Medicaid Services	<p>We proposed to include this measure in the Family Medicine specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease.¹⁰³⁷ Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations.¹⁰³⁸ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.</p>

¹⁰³⁷ See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰³⁸ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

We received no public comments on the measure(s) proposed for addition to this specialty set. For the reasons stated above and in the proposed rule (89 FR 62333), we are finalizing the above measure(s) for addition to the *Family Medicine Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.13. Family Medicine

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE FAMILY MEDICINE SPECIALTY SET							
Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.							
CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Removal
N/A / 3475e	472	CMS249v7	eCQM Specifications	Process	Appropriate Use of DXA Scans in Women Under 65 Years Who Do Not Meet the Risk Factor Profile for Osteoporotic Fracture: Percentage of female patients 50 to 64 years of age without select risk factors for osteoporotic fracture who received an order for a dual-energy x-ray absorptiometry (DXA) scan during the measurement period.	Centers for Medicare & Medicaid Services	This measure was proposed for removal beginning with the CY 2025 performance period/2027 MIPS payment year. See Table Group C for rationale.

We received no public comments on the measure(s) proposed for removal from this specialty set. For the reasons stated above and in the proposed rule (89 FR 62334), we are finalizing the above measure(s) for removal from the *Family Medicine Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Note: Where applicable, see Table Group C of this Appendix for any comments and responses pertaining to measures that were proposed for removal from MIPS.

B.14. Gastroenterology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Gastroenterology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable.

MEASURES FINALIZED FOR ADDITION TO THE GERIATRICS SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
! (Outcome)	3665 / N/A	495	N/A	MIPS CQM Specifications	Patient-Reported Outcome-Based Performance Measure	Ambulatory Palliative Care Patients' Experience of Feeling Heard and Understood: The percentage of top-box responses among patients aged 18 years and older who had an ambulatory palliative care visit and report feeling heard and understood by their palliative care clinician and team within 2 months (60 days) of the ambulatory palliative care visit.	American Academy of Hospice and Palliative Medicine (AAHPM)	We proposed to include this measure in the Geriatrics specialty set as it will be clinically relevant to this clinician type. This PROM will help to fill a gap for patients receiving palliative care by capturing the patient's voice and experience of care by assessing communication and shared decision making with the clinician. This is an important patient-centered measure that helps patients feel heard and understood which can effectively improve the quality of care received and outcomes for patients in palliative care. Allowing patients to feel heard and understood adds an important dimension to the care planning for this unique patient population commonly cared for by clinicians in this specialty. As more patients are living longer with multiple comorbidities, especially true for the advanced heart disease patient population, early emergence of palliative care into the overall care of cardiac patients can notably improve their quality of life, patient satisfaction, and reduction in symptoms. ¹⁰³⁹ This measure is predicated on existing guidelines and conceptual models ¹⁰⁴⁰ and can facilitate and improve effective patient-clinician communication that engenders trust, acknowledgement, and a whole-person orientation to the care that is provided. Through the benefits of enhanced patient-provider communication, this measure will improve the quality of care received and outcomes for patients receiving palliative care. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set.

¹⁰³⁹ See footnote Kilic et al., 2020 in Table B.4a of this Appendix.

¹⁰⁴⁰ See footnote National Consensus Project for Quality Palliative Care, 2018 in Table B.4a of this Appendix.

B.16. Geriatrics

MEASURES FINALIZED FOR ADDITION TO THE GERIATRICS SPECIALTY SET

* ! (Outcome)	2483 / N/A	503	N/A	MIPS CQM Specifications	Patient-Reported Outcome-Based Performance Measure	Gains in Patient Activation Measure (PAM®) Scores at 12 Months: The Patient Activation Measure® (PAM®) is a 10 – or 13 – item questionnaire that assesses an individual’s knowledge, skills and confidence for managing their health and health care. The measure assesses individuals on a 0-100 scale that converts to one of four levels of activation, from low (1) to high (4). The PAM® performance measure (PAM®-PM) is the change in score on the PAM® from baseline to follow-up measurement.	Insignia Health, LLC, a wholly owned subsidiary of Phreesia	We proposed to include this measure in the Geriatrics specialty set as it will be clinically relevant to this clinician type. The addition of this measure to this specialty set will be feasible given its use through the continuum of care and across different clinical settings. This measure addresses chronic conditions and outcomes, both of which are high priority areas for measure consideration for MIPS. It is utilized in research within the U.S. and internationally and has also been shown to be valid and reliable in different clinical settings and under different payment models. ¹⁰⁴¹ The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set.

¹⁰⁴¹ See footnote Phreesia, 2024 in Table B.7 of this Appendix.

B.16. Geriatrics

MEASURES FINALIZED FOR ADDITION TO THE GERIATRICS SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	<p>Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.</p>	Centers for Medicare & Medicaid Services	<p>We proposed to include this measure in the Geriatrics specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease.¹⁰⁴² Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations.¹⁰⁴³ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.</p>

We received public comments on the measure(s) proposed for addition to this specialty set. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed addition of measure Q495: Ambulatory Palliative Care Patients' Experience of Feeling Heard and Understood being added to this specialty set. Commenters supported the expanded use of this palliative care-developed measure. One commenter indicated that this measure would help ensure patient care is holistic, patient-centered, responsive to the needs of those with serious illnesses in ambulatory settings. One commenter supported measure Q503:

¹⁰⁴² See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁴³ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

Gains in PAM® Scores at 12 Months being added to this specialty set as it will offer a high value, cross cutting and clinically significant patient-reported measure to participating clinicians.

Response: We thank the commenters for supporting the addition of these measures to the Geriatrics specialty set.

Comment: One commenter stated the exclusions for measure Q495 should include diagnoses of cognitive impairment, dementia, and Alzheimer's disease before finalizing the measure to take into consideration the limitations with patients who are not as engaged in their own decision-making as they may not be able to appropriately respond to the survey administered that determines the top-box score for this measure.

Response: We thank the commenter for their feedback. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years. Per the measure steward, the measure applies a person-centered approach that recognizes the person beyond the disease and prioritizes peoples' health concerns as they see them. The measure includes an exclusion for surveys filled out by proxy as well as an exception for patient who did not respond to the questions.¹⁰⁴⁴

Comment: One commenter expressed concerns about the addition of measure Q503 to this specialty set, stating that the measure may pose challenges for use by geriatricians, who treat older adults with medical complexities and living with multiple chronic conditions. Due to the comprehensive approach needed in addressing and individualizing care in older adults with multimorbidity and the potential accumulation of disease states and medications, it may be difficult for patients to keep track of and build ability to manage their own health and health care. The commenter encouraged CMS to reconsider the inclusion of measure Q503 in the Geriatrics specialty set.

Response: The MIPS quality measure inventory does not currently include a measure with an alternate activation survey, and, as such, we are including this measure to fill a gap in care within the Geriatrics specialty set. Because clinicians have the flexibility to choose which measures to report, the adoption of this measure is not a requirement for clinicians. Instead, the addition of this measure enhances clinician choice when they select which measures to report. The PAM® is a disease-agnostic measure meant to provide meaningful information about changes in activation across many patient populations and aligns with CMS health priorities of capturing the patient voice and ensuring the patients can be partners in healthcare decisions with their clinicians. This will be a valuable tool for all patients within this scope of practice. This measure does contain exclusions for dementia and cognitive impairment to maintain an appropriate patient population for the measure's assessment.

Comment: One commenter agreed with CMS that vaccination is important to reduce morbidity and mortality caused by COVID-19 and recommends vaccination for older adults particularly those who are at higher risk of poor outcomes but was concerned that the Adult COVID-19 Vaccination Status measure will add burden to clinicians without meaningful improvements in care, quality, or vaccination rates. Given the fluctuating landscape of COVID-19 and related interim guidelines, the commenter believed that complying with the CDC recommendations that are not yet final would be difficult. If finalized, the commenter recommended CMS explore qualifiers that take into consideration these challenges as well as that the evidence is based on retrospective data that reflects the experience during a PHE when the disease was more deadly.

Response: MIPS eligible clinicians will not be required to report this measure because they have the flexibility to choose measures that are relevant and meaningful to their practice. This measure provides an opportunity to discuss vaccines with the patient. This measure represents an important clinical topic following the recently ended PHE for COVID-19. This process measure represents a CMS high priority clinical topic and fills a gap in MIPS by addressing COVID-19 vaccination status for all patients and ensuring clinician vaccination efforts at the point of care (for example, care for wellness and prevention against COVID-19). Due to the measure being new, there are not yet any benchmarks for MIPS.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62347 through 62349), we are finalizing the above measure(s) for addition to the *Geriatrics Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.17. Hospitalists

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Hospitalists specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set. This specialty set had no measures proposed for addition or removal. Measures with substantive changes as marked with an asterisk (*) are addressed under Table Group D.

B.18. Infectious Disease

MEASURES FINALIZED FOR ADDITION TO THE INFECTIOUS DISEASE SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Infectious Disease specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease. ¹⁰⁴⁶ Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations. ¹⁰⁴⁷ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.

We received public comments on the measure(s) proposed for addition to this specialty set. The following is a summary of the comments we received and our responses.

Comment: Two commenters supported the proposed addition of measure Q503: Gains in Patient Activation Measure (PAM®) Scores at 12 Months to this specialty set. One of these commenters noted that the inclusion of this measure in the specialty set will offer a high value, cross cutting and clinically significant patient-reported measure to participating clinicians.

¹⁰⁴⁶ See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁴⁷ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

Response: We thank the commenters for supporting the addition of this measure to the Infectious Disease specialty set.

Comment: One commenter did not support the addition of the Adult COVID-19 Vaccination Status measure to this specialty set. The commenter stated that given the unique concerns surrounding COVID-19 immunization, it may be difficult to achieve high-quality benchmarks. Many patients will accept other vaccines but will not accept the COVID-19 vaccine. If clinicians are benchmarked against a national average for this measure, the regional variation of views toward COVID-19 immunizations will cause a disadvantage for infectious disease clinicians in certain geographic regions of the country.

Response: We acknowledge commenters' concerns; however, MIPS eligible clinicians will not be required to report this measure because they have the flexibility to choose measures that are relevant and meaningful to their practice. This measure provides an opportunity to discuss vaccines with the patient. This measure represents an important clinical topic following the recently ended PHE for COVID-19. This process measure represents a CMS high priority clinical topic and fills a gap in MIPS by addressing COVID-19 vaccination status for all patients and ensuring clinician vaccination efforts at the point of care (for example, care for wellness and prevention against COVID-19). Due to the measure being new, there are not yet any benchmarks for MIPS.

For the reasons stated above and in the proposed rule (89 FR 62355 through 62356), we are finalizing the above measure(s) for addition to the *Infectious Disease Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.19. Internal Medicine

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Internal Medicine specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable.

B.19. Internal Medicine

PREVIOUSLY FINALIZED MEASURES IN THE INTERNAL MEDICINE SPECIALTY SET							
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title and Description	Measure Steward
* § ! (Outcome)	0059 / N/A	001	CMS122v13	Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQM Specifications	Intermediate Outcome	Diabetes: Glycemic Status Assessment Greater Than 9%: Percentage of patients 18-75 years of age with diabetes who had a glycemic status assessment (hemoglobin A1c [HbA1c] or glucose management indicator [GMI]) > 9.0% during the measurement period.	National Committee for Quality Assurance
§	0081 / 0081e	005	CMS135v13	eCQM Specifications, MIPS CQM Specifications	Process	Heart Failure (HF): Angiotensin-Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) or Angiotensin Receptor-Nepriylsin Inhibitor (ARNI) Therapy for Left Ventricular Systolic Dysfunction (LVSD): Percentage of patients aged 18 years and older with a diagnosis of heart failure (HF) with a current or prior left ventricular ejection fraction (LVEF) ≤ 40% who were prescribed ACE inhibitor or ARB or ARNI therapy either within a 12-month period when seen in the outpatient setting OR at each hospital discharge.	American Heart Association
§	0067 / N/A	006	N/A	MIPS CQM Specifications	Process	Coronary Artery Disease (CAD): Antiplatelet Therapy: Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease (CAD) seen within a 12-month period who were prescribed aspirin or clopidogrel. American Psychiatric Association

B.19. Internal Medicine

MEASURES FINALIZED FOR ADDITION TO THE INTERNAL MEDICINE SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Internal Medicine specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease. ¹⁰⁴⁸ Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the (ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations. ¹⁰⁴⁹ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.

We received no public comments on the measure(s) proposed for addition to this specialty set. For the reasons stated above and in the proposed rule (89 FR 62373), we are finalizing the above measure(s) for addition to the *Internal Medicine Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

¹⁰⁴⁸ See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁴⁹ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

B.19. Internal Medicine

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE INTERNAL MEDICINE SPECIALTY SET							
Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.							
CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Removal
N/A / 3475e	472	CMS24 9v7	eCQM Specifications	Process	Appropriate Use of DXA Scans in Women Under 65 Years Who Do Not Meet the Risk Factor Profile for Osteoporotic Fracture: Percentage of female patients 50 to 64 years of age without select risk factors for osteoporotic fracture who received an order for a dual-energy x-ray absorptiometry (DXA) scan during the measurement period.	Centers for Medicare & Medicaid Services	This measure was proposed for removal beginning with the CY 2025 performance period/2027 MIPS payment year. See Table Group C for rationale.

We received no public comments on the measure(s) proposed for removal from this specialty set. For the reasons stated above and in the proposed rule (89 FR 62374), we are finalizing the above measure(s) for removal from the *Internal Medicine Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Note: Where applicable, see Table Group C of this Appendix for any comments and responses pertaining to measures that were proposed for removal from MIPS.

B.20. Interventional Radiology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Interventional Radiology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable.

! (Outcome)	3665 / N/A	495	N/A	MIPS CQM Specifications	Patient-Reported Outcome-Based Performance Measure	Ambulatory Palliative Care Patients' Experience of Feeling Heard and Understood: The percentage of top-box responses among patients aged 18 years and older who had an ambulatory palliative care visit and report feeling heard and understood by their palliative care clinician and team within 2 months (60 days) of the ambulatory palliative care visit.	American Academy of Hospice and Palliative Medicine (AAHPM)	We proposed to include this measure in the Nephrology specialty set as it will be clinically relevant to this clinician type. This PRO-PM will help to fill a gap for patients receiving palliative care by capturing the patient's voice and experience of care by assessing communication and shared decision making with the clinician. This is an important patient-centered measure that helps patients feel heard and understood which can effectively improve the quality of care received and outcomes for patients in palliative care. Allowing patients to feel heard and understood adds an important dimension to the care planning for this unique patient population commonly cared for by clinicians in this specialty. As more patients are living longer with multiple comorbidities, especially true for the advanced heart disease patient population, early emergence of palliative care into the overall care of cardiac patients can notably improve their quality of life, patient satisfaction, and reduction in symptoms. ¹⁰⁵⁰ This measure is predicated on existing guidelines and conceptual models ¹⁰⁵¹ and can facilitate and improve effective patient-clinician communication that engenders trust, acknowledgement, and a whole-person orientation to the care that is provided. Through the benefits of enhanced patient-provider communication, this measure will improve the quality of care received and outcomes for patients receiving palliative care. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set.

¹⁰⁵⁰ See footnote Kilic et al., 2020 in Table B.4a of this Appendix.

¹⁰⁵¹ See footnote National Consensus Project for Quality Palliative Care, 2018 in Table B.4a of this Appendix.

B.22. Nephrology

MEASURES FINALIZED FOR ADDITION TO THE NEPHROLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	<p>Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.</p>	Centers for Medicare & Medicaid Services	<p>We proposed to include this measure in the Nephrology specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease.¹⁰⁵² Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations.¹⁰⁵³ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.</p>

¹⁰⁵² See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁵³ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

B.22. Nephrology

MEASURES FINALIZED FOR ADDITION TO THE NEPHROLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	510	N/A	MIPS CQM Specifications	Process	<p>First Year Standardized Waitlist Ratio (FYSWR): The number of newly initiated patients on dialysis in a practitioner group who are under the age of 75 and were either listed on the kidney or kidney-pancreas transplant waitlist or received a living donor transplant within the first year of initiating dialysis. The practitioner group is inclusive of physicians and advanced practice providers. The measure is the ratio-observed number of waitlist events in a practitioner group to its expected number of waitlist events. The measure uses the expected waitlist events calculated from a Cox model, which is adjusted for age, patient comorbidities, and other risk factors at the time of dialysis.</p>	Centers for Medicare & Medicaid Services	<p>We proposed to include this measure in the Nephrology specialty set as it will be clinically relevant to this clinician type. The measure's intended objective consists of improving the overall health of patients on dialysis, with nephrologists at the forefront of caring for this patient population. Clinicians within this specialty are responsible for the education of patients about the option of transplantation, referral of patients to a transplant center for evaluation, completion of the evaluation process, and optimizing the health of the patient while on dialysis. All clinicians should be involved and actively work towards providing patients with high quality care including ensuring placement on the transplant list as quickly as possible. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set. See Table A.7 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.</p>

B.22. Nephrology

MEASURES FINALIZED FOR ADDITION TO THE NEPHROLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	511	N/A	MIPS CQM Specifications	Process	<p>Percentage of Prevalent Patients Waitlisted (PPPW) and Percentage of Prevalent Patients Waitlisted in Active Status (aPPPW): The measure tracks dialysis patients who are under the age of 75 in a practitioner group and on the kidney or kidney-pancreas transplant waitlist (all patients or patients in active status). This measure is a risk-adjusted percentage of waitlist events among dialysis patients.</p>	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Nephrology specialty set as will be clinically relevant to this clinician type. The maintenance of end stage renal disease patients on active status on the waitlist is additionally important given demonstrated disparities and positive association with subsequent transplantation. These practices are important for nephrologists who are at the forefront of caring for this patient population. This is an important area to which dialysis practitioners can contribute through ensuring patients remain healthy and complete any ongoing testing activities required to remain active on the waitlist. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set. See Table A.8 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.

We received public comments on the measure(s) proposed for addition to this specialty set. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed addition of measure Q495: Ambulatory Palliative Care Patients' Experience of Feeling Heard and Understood to this specialty set. Commenters supported the expanded use of this palliative care-developed measure. One commenter indicated that this measure would help ensure patient care is holistic, patient-centered, and responsive to the needs of those with serious illnesses in ambulatory settings.

Response: We thank the commenters for supporting the addition of this measure to the Nephrology specialty set.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62386 through 62389), we are finalizing the above measure(s) for addition to the *Nephrology Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.23. Neurology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Neurology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set. This specialty set had no measures proposed for addition or removal. Measures with substantive changes as marked with an asterisk (*) are addressed under Table Group D.

B.24. Neurosurgical

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE NEUROSURGICAL SPECIALTY SET							
Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.							
CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Removal
NA / NA	260	N/A	MIPS CQM Specifications	Outcome	Rate of Carotid Endarterectomy (CEA) for Asymptomatic Patients, without Major Complications (Discharged to Home by Post-Operative Day #2): Percent of asymptomatic patients undergoing Carotid Endarterectomy (CEA) who are discharged to home no later than post-operative day #2.	Society for Vascular Surgery	This measure was proposed for removal beginning with the CY 2025 performance period/2027 MIPS payment year. See Table Group C for rationale.
N/A / N/A	409	N/A	MIPS CQM Specifications	Outcome	Clinical Outcome Post Endovascular Stroke Treatment: Percentage of patients with a Modified Rankin Score (mRS) score of 0 to 2 at 90 days following endovascular stroke intervention.	Centers for Medicare & Medicaid Services	This measure was proposed for removal beginning with the CY 2025 performance period/2027 MIPS payment year. See Table Group C for rationale.

We received no public comments on the measure(s) proposed for removal from this specialty set. For the reasons stated above and in the proposed rule (89 FR 62397), we are finalizing the above measure(s) for removal from the *Neurosurgical Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Note: Where applicable, see Table Group C of this Appendix for any comments and responses pertaining to measures that were proposed for removal from MIPS.

B.25. Nutrition/Dietician

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Nutrition/Dietician specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set. This specialty set had no measures proposed for addition or removal. Measures with substantive changes as marked with an asterisk (*) are addressed under Table Group D.

OCHIN

B.26. Obstetrics/Gynecology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Obstetrics/Gynecology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable.

American Psychiatric Association

B.26. Obstetrics/Gynecology

MEASURES FINALIZED FOR ADDITION TO THE OBSTETRICS/GYNECOLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	<p>Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.</p>	Centers for Medicare & Medicaid Services	<p>We proposed to include this measure in the Obstetrics/ Gynecology specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease.¹⁰⁵⁴ Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations.¹⁰⁵⁵ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.</p>

We received no public comments on the measure(s) proposed for addition to this specialty set. For the reasons stated above and in the proposed rule (89 FR 62407), we are finalizing the above measure(s) for addition to the *Obstetrics/Gynecology Specialty Set*

¹⁰⁵⁴ See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁵⁵ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.26. Obstetrics/Gynecology

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE OBSTRETRICS/GYNECOLOGY SPECIALTY SET							
Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.							
CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Removal
N/A / N/A	433	N/A	MIPS CQM Specifications	Outcome	Proportion of Patients Sustaining a Bowel Injury at the time of any Pelvic Organ Prolapse Repair: Percentage of patients undergoing surgical repair of pelvic organ prolapse that is complicated by a bowel injury at the time of index surgery that is recognized intraoperatively or within 30 days after surgery.	American Urogynecologic Society	This measure was proposed for removal beginning with the CY 2025 performance period/2027 MIPS payment year. See Table Group C for rationale.
N/A / 3475e	472	CMS249v7	eCQM Specifications	Process	Appropriate Use of DXA Scans in Women Under 65 Years Who Do Not Meet the Risk Factor Profile for Osteoporotic Fracture: Percentage of female patients 50 to 64 years of age without select risk factors for osteoporotic fracture who received an order for a dual-energy x-ray absorptiometry (DXA) scan during the measurement period.	Centers for Medicare & Medicaid Services	This measure was proposed for removal beginning with the CY 2025 performance period/2027 MIPS payment year. See Table Group C for rationale.

We received no public comments on the measure(s) proposed for removal from this specialty set. For the reasons stated above and in the proposed rule (89 FR 62408), we are finalizing the above measure(s) for removal from the *Obstetrics/Gynecology Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Note: Where applicable, see Table Group C of this Appendix for any comments and responses pertaining to measures that were proposed for removal from MIPS.

B.27a. Oncology/Hematology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Oncology/Hematology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable.

! (Appropriate Use)	N/A / N/A	506	N/A	MIPS CQM Specifications	Process	<p>Positive PD-L1 Biomarker Expression Test Result Prior to First-Line Immune Checkpoint Inhibitor Therapy: Percentage of patients, aged 18 years and older, with a diagnosis of metastatic non-small cell lung cancer (NSCLC) or squamous cell carcinoma of head and neck (HNSCC) on first-line immune checkpoint inhibitor (ICI) therapy, who had a positive PD-L1 biomarker expression test result prior to giving ICI therapy.</p>	Society for Immunotherapy of Cancer (SITC)	<p>We proposed to include this measure in the Oncology/ Hematology specialty set as it will be clinically relevant to this clinician type. Immunotherapy is a rapidly developing and changing subspecialty in the realm of oncology, and this measure will fill a gap within the oncologic clinical topic. The incorporation of this measure in this specialty set will help promote appropriate intervention and timeliness of PD-L1 biomarker expression testing prior to initiation of first-line treatment for the metastatic non-small cell lung cancer or squamous cell carcinoma of head and neck. This timeliness of treatment initiation can lead to improvements in patient mortality and morbidity.¹⁰⁵⁶ It's important to address the proper diagnosis of metastatic non-small cell lung cancer or squamous cell carcinoma that may impact treatment decisions so that appropriate treatment delivery is not delayed, nor ineffective therapies prescribed which could both result in poor clinical outcomes and unnecessary healthcare costs.¹⁰⁵⁷ See Table A.1 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.</p>

¹⁰⁵⁶ See footnote Pai et al., 2020 in Table A.1 of this Appendix

¹⁰⁵⁷ See footnotes Lim et al., 2015 and Pai et al., 2020 in Table A.1 of this Appendix.

B.27a. Oncology/Hematology

MEASURES FINALIZED AND NOT FINALIZED FOR ADDITION TO THE ONCOLOGY/HEMATOLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	507	N/A	MIPS CQM Specifications	Process	<p>Appropriate Germline Testing for Ovarian Cancer Patients: Percentage of patients, aged 18 and older, diagnosed with epithelial ovarian, fallopian tube, or primary peritoneal cancer who undergo germline testing within 6 months of diagnosis.</p>	American Society of Clinical Oncology	<p>We proposed to include this measure in the Oncology/ Hematology specialty set as it will be clinically relevant to this clinician type and will fill a gap within the oncologic clinical topic. This measure addresses patients diagnosed with epithelial ovarian, fallopian tube, or primary peritoneal cancer who undergo germline testing within 6 months of their diagnosis and is predicated on existing clinical guidelines and recommendations. It also addresses a CMS priority that could allow for more personalized diagnostic, predictive, prognostic, and therapeutic strategies for the patient. Current recommendations for all women diagnosed with ovarian cancer is to receive genetic testing, however, only approximately 30 percent of women undergo any genetic testing.¹⁰⁵⁸ The high incidence of these mutations and the advent of therapy targeted toward BRCA mutations warrant testing in all individuals diagnosed with ovarian cancer for the purpose of determining treatment recommendations, risk of other cancers, and need for cascade testing of family members. See Table A.2 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.</p>

¹⁰⁵⁸ See footnote Konstantinopoulos et al., 2020 in Table A.2 of this Appendix.

B.27a. Oncology/Hematology

MEASURES FINALIZED AND NOT FINALIZED FOR ADDITION TO THE ONCOLOGY/HEMATOLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
! (Outcome)	CBE 3718 / N/A	N/A	N/A	MIPS CQM Specifications	Patient-Reported Outcome-based Performance Measure (PRO-PM)	Patient-Reported Pain Interference Following Chemotherapy among Adults with Breast Cancer: The PRO-PM will assess pain interference following chemotherapy administered with curative intent to adult patients with breast cancer.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Oncology/ Hematology specialty set as it will be clinically relevant to this clinician type and will fill a gap within the oncologic clinical topic. This measure addresses a CMS high priority as a patient-reported outcome-based performance quality measure accounting for patient experience of care for this patient population. It is predicated on existing clinical guidelines and recommendations. ¹⁰⁵⁹ For the breast cancer patient population, it's important to routinely assess pain to properly identify barriers to acceptable pain management and to intervene appropriately, which can improve the patient's health outcome and quality of life. ¹⁰⁶⁰ See Table A.3 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.
! (Outcome)	CBE 3720 / N/A	N/A	N/A	MIPS CQM Specifications	Patient-Reported Outcome-based Performance Measure (PRO-PM)	Patient-Reported Fatigue Following Chemotherapy among Adults with Breast Cancer: The PRO-PM will assess fatigue following chemotherapy administered with curative intent to adult patients with breast cancer.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Oncology/ Hematology specialty set as it will be clinically relevant to this clinician type, addresses a CMS high priority as a PRO-PM, and will fill a gap within the oncologic clinical topic. It takes into consideration the patient voice/experience of care for those patients with breast cancer with fatigue experienced following chemotherapy. PRO assessment in routine care remains underutilized, and very few PRO-PMs have been validated for the cancer population. By taking into consideration patient voice, necessary interventions can be completed to help improve their quality of life during cancer treatment. See Table A.4 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.

B.27a. Oncology/Hematology

MEASURES FINALIZED AND NOT FINALIZED FOR ADDITION TO THE ONCOLOGY/HEMATOLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Oncology/ Hematology specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease. ¹⁰⁶¹ Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations. ¹⁰⁶² Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.

We received public comments on the measure(s) proposed for addition to this specialty set. The following is a summary of the comments we received and our responses.

Comment: Two commenters supported proposed addition of the Positive PD-L1 Biomarker Expression Test Result Prior to First-Line Immune Checkpoint Inhibitor Therapy and the Appropriate Germline Testing for Ovarian Cancer Patients measures to this

¹⁰⁶¹ See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁶² See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

specialty set. One of these commenters also supported the Patient-Reported Pain Interference Following Chemotherapy among Adults with Breast Cancer and Patient-Reported Fatigue Following Chemotherapy among Adults with Breast Cancer measures being added to this specialty set.

Response: We thank the commenters for supporting these measures being added to the Oncology/Hematology specialty set.

Comment: One commenter supported the addition of the Patient-Reported Pain Interference Following Chemotherapy among Adults with Breast Cancer and Patient-Reported Fatigue Following Chemotherapy among Adults with Breast Cancer measures to this specialty set. However, the commenter noted that these measures are currently limited to one tool for data collection (PROMIS). The commenter indicated licensing and fees are required to use the screening tool, which creates a barrier to adoption when there are additional screening tools available that are equally useful to manage patient care. The commenter recommended that the measure developers broaden the measure numerators to include other validated screening tools so that more clinicians can report on the measures. There are additional validated tools that are widely used in oncologic care.

Response: We acknowledge the commenter's concerns; however, MIPS eligible clinicians will not be required to report this measure because they have the flexibility to choose measures that are relevant and meaningful to their practice. This measure addresses a CMS high priority as a patient-reported outcome-based performance quality measure accounting for patient experience of care for this patient population. The current measure has been fully developed and tested utilizing the PROMIS tool for data collection, showing it is a reliable and valid tool for the purposes of reporting this measure. We recognize that the measures are limited to one tool for data collection; however, the tool is publicly available at no cost in paper form. Licensing fees may be applicable for permissions to integrate into electronic platforms but are not required for use for measure reporting. As performance for these measures is based upon the outcome of the assessment, it is important the same tool is being utilized across submissions to ensure continuity in data and allowing for appropriate comparisons. However, because the measure steward is no longer able to maintain the quality measures, we are not finalizing these measures under Tables A.3 and A.4 of this Appendix.

Comment: Two commenters did not support the proposed addition of the Adult COVID-19 Vaccination measure to this specialty set. Recommendations for vaccinations and boosters are changing frequently, and therefore, measure specifications need to be updated accordingly to comport with this frequently changing landscape. Lastly, the commenters stated that measures within this specialty set should align with those in the Advancing Cancer Care MVP.

Response: We acknowledge the commenters' concerns; however, MIPS eligible clinicians will not be required to report this measure because they have the flexibility to choose measures that are relevant and meaningful to their practice. This measure provides an opportunity to discuss vaccines with the patient. This measure represents an important clinical topic following the recently ended PHE for COVID-19. This process measure represents a CMS high priority clinical topic and fills a gap in MIPS by addressing COVID-19 vaccination status for all patients and ensuring clinician vaccination efforts at the point of care (for example, care for wellness and prevention against COVID-19). We also note that while there is generally measure alignment between the specialty measure sets and MVPs, this is not a requirement, and the MVP is not meant to be a copy of the specialty measure set. We understand COVID-19 vaccination guidelines have changed and may continue to change. Specifying the measure by referring to "up to date" guidelines ensures the measure remains current and valid despite future guideline updates. As specified, the measure holds a clinician accountable for the most current guidelines on the date of the denominator eligible encounter. We consider this to be a fair approach as it does not judge clinicians by standards that are not known to the clinician and not applicable at the time of the encounter.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62415 through 62418), we are finalizing measures Q506: Positive PD-L1 Biomarker Expression Test Result Prior to First-Line Immune Checkpoint Inhibitor Therapy, Q507: Appropriate Germline Testing for Ovarian Cancer Patients, and Q508: Adult COVID-19 Vaccination Status for addition to the *Oncology/Hematology Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. However, we are not finalizing the Patient-Reported Pain Interference Following Chemotherapy among Adults with Breast Cancer and Patient-Reported Fatigue Following Chemotherapy among Adults with Breast Cancer measures for addition to this specialty set because the measure steward is no longer able to maintain the quality measures. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.27a. Oncology/Hematology

PREVIOUSLY FINALIZED MEASURES FINALIZED AND NOT FINALIZED FOR REMOVAL FROM THE ONCOLOGY/HEMATOLOGY SPECIALTY SET							
Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.							
CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Removal
1860 / N/A	452	N/A	MIPS CQM Specifications	Process	Patients with Metastatic Colorectal Cancer and RAS (KRAS or NRAS) Gene Mutation Spared Treatment with Anti-epidermal Growth Factor Receptor (EGFR) Monoclonal Antibodies: Percentage of adult patients (aged 18 or over) with metastatic colorectal cancer and RAS (KRAS or NRAS) gene mutation spared treatment with anti-EGFR monoclonal antibodies.	American Society of Clinical Oncology	This measure was proposed for removal beginning with the CY 2025 performance period/2027 MIPS payment year. See Table Group C for rationale.

We received no public comments on the measure(s) proposed for removal from this specialty set. For the reasons stated above and in the proposed rule (89 FR 62419), we are finalizing the above measure(s) for removal from the *Oncology/Hematology Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years: measure Q452. As indicated under Table C.3 of this Appendix, measure Q144: Oncology: Medical and Radiation – Plan of Care for Pain was not finalized for removal from MIPS. Measure Q144 has been removed from this removal table and added back to the previously finalized measures table. Note: Where applicable, see Table Group C of this Appendix for any comments and responses pertaining to measures that were proposed for removal from MIPS.

B.27b. Radiation Oncology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Radiation Oncology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable. Measure Q144: Oncology: Medical and Radiation – Plan of Care for Pain was not finalized for removal under Table C.3 of this Appendix. Therefore, the measure has been added back into the previously finalized specialty set and removed from the Removal table, which resulted in the Removal table being removed in its entirety in this final rule. The reason for retaining measure Q144 was addressed under Table Group C.

B.27b. Radiation Oncology

National Committee for Quality Assurance

B.28. Ophthalmology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Ophthalmology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set. This specialty set had no measures proposed for addition or removal. Measures with substantive changes as marked with an asterisk (*) are addressed under Table Group D. As indicated in the Table Group B Introduction, we proposed to rename this specialty set from “Ophthalmology/Optomety” to “Ophthalmology” under the CY 2025 PFS proposed rule (89 FR 62422). We also proposed a new Optometry specialty set under Table B.29 of this Appendix.

American Society of Retina Specialists

B.29. Optometry

As indicated in the introductory language of Table Group B of this Appendix to this final rule, we proposed to add a new Optometry specialty set. In addition to the considerations discussed in the introductory language of Table Group B, the Optometry specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we proposed to add to this specialty set.

B.29. Optometry

MEASURES FINALIZED FOR ADDITION TO THE OPTOMETRY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
* ! (Care Coordination)	N/A / N/A	019	CMS 142v13	eCQM Specifications	Process	Diabetic Retinopathy: Communication with the Physician Managing Ongoing Diabetes Care: Percentage of patients aged 18 years and older with a diagnosis of diabetic retinopathy who had a dilated macular or fundus exam performed with documented communication to the physician who manages the ongoing care of the patient with diabetes mellitus regarding the findings of the macular or fundus exam at least once during the performance period.	American Academy of Ophthalmology	We proposed to include this measure in the Optometry specialty set as it will be clinically relevant to this clinician type. An Optometrist is needed to inform a primary care clinician about a particular patient's retinopathy severity, possible diabetic macular edema, or other ocular comorbidities. Retinopathy serves as a strong predictor of other serious medical conditions such as heart attack, stroke, kidney failure, amputation, and others. ¹⁰⁶³ Without regular reporting from the optometrist on this issue, the primary care clinician lacks valuable information key to the overall management of the patient. This measure is essential to patient safety and completes the feedback essential for treating a deadly, common disease. ¹⁰⁶⁴ Better communication between eye specialists and primary care clinicians can play a critical role in patient care, as it's an important mechanism for clinicians to communicate with one another about a patients' disease symptoms, adherence to care plan, and treatment plans. ¹⁰⁶⁵ The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure

Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
								would not have been finalized for inclusion within this specialty measure set.
* §	0055 / N/A	117	CMS 131v13	eCQM Specifications, MIPS CQM Specifications	Process	Diabetes: Eye Exam: Percentage of patients 18-75 years of age with diabetes and an active diagnosis of retinopathy in any part of the measurement period who had a retinal or dilated eye exam by an eye care professional during the measurement period or diabetics with no diagnosis of retinopathy in any part of the measurement period who had a retinal or dilated eye exam by an eye care professional during the measurement period or in the 12 months prior to the measurement period.	National Committee for Quality Assurance	We proposed to include this measure in the Optometry specialty set as it will be clinically relevant to this clinician type. This measure could help accurately assess a clinician's ability to diagnose and treat patients safely and efficiently. The numerator options give more granular data that can be captured to discern between patients with and without evidence of retinopathy. This information could give insight into those patients with controlled blood sugar and those with uncontrolled blood sugar. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set.
* § (Patient Safety)	N/A / N/A	130	CMS 68v14	eCQM Specifications, MIPS CQM Specifications	Process	Documentation of Current Medications in the Medical Record: Percentage of visits for which the eligible clinician attests to documenting a list of current medications using all immediate resources available on the date of the encounter.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Optometry specialty set as it is clinically relevant to this clinician type. Documentation of current medications in the medical record facilitates the process of medication review and reconciliation by the clinician, which is necessary for reducing ADEs and promoting medication safety. The need for clinician-to-clinician coordination regarding medication records, and the existing gap in implementation, is highlighted in the American Medical Association's Physician's Role in Medication Reconciliation, which states that "critical patient information, including medical and medication histories, current medications

B.29. Optometry

B.29. Optometry

MEASURES FINALIZED FOR ADDITION TO THE OPTOMETRY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
						at least two high-risk medications from the same drug class.		effects and toxicity. ¹⁰⁶⁸ Medication errors can occur anywhere throughout the many steps in the medication management process, with one of the most common error sources being poor interprofessional communication resulting in poor collaborative medication management. ¹⁰⁶⁹ The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set.
* ! (Care Coordination)	N/A / N/A	374	CMS 50v13	eCQM Specifications, MIPS CQM Specifications	Process	Closing the Referral Loop: Receipt of Specialist Report: Percentage of patients with referrals, regardless of age, for which the referring clinician receives a report from the clinician to whom the patient was referred.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Optometry specialty set as it is clinically relevant to this clinician type. Including this measure will ensure patients referred to Optometrist for a consultation complete the encounter with a consult report being returned to the referring physician. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set.

We received public comments on the measure(s) proposed for addition to this specialty set. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the creation of separate specialty sets for ophthalmology and optometry. The commenter thanked CMS for addressing their concerns that including optometry in the Ophthalmology specialty set could encourage providers to report on treatments outside their expertise, licensure, or experience.

Response: We thank the commenter for supporting this update in the specialty sets.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62428 through 62431), we are finalizing the above measure(s) for addition to the *Optometry Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.30. Orthopedic Surgery

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Orthopedic Surgery specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set. This specialty set had no measures proposed for addition or removal. Measures with substantive changes as marked with an asterisk (*) are addressed under Table Group D.

OCHIN

B.31. Otolaryngology

MEASURES FINALIZED FOR ADDITION TO THE OTOLARYNGOLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Otolaryngology specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease. ¹⁰⁷⁰ Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations. ¹⁰⁷¹ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.

We received no public comments on the measure(s) proposed for addition to this specialty set. For the reasons stated above and in the proposed rule (89 FR 62446), we are finalizing the above measure(s) for addition to the *Otolaryngology Specialty Set* as

¹⁰⁷⁰ See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁷¹ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.32. Pathology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Pathology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set. This specialty set had no measures proposed for addition or removal. Measures with substantive changes as marked with an asterisk (*) are addressed under Table Group D.

MEASURES FINALIZED FOR ADDITION TO THE PREVENTIVE MEDICINE SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	<p>Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.</p>	Centers for Medicare & Medicaid Services	<p>We proposed to include this measure in the Preventive Medicine specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease.¹⁰⁷² Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations.¹⁰⁷³ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.</p>

We received no public comments on the measure(s) proposed for addition to this specialty set. For the reasons stated above and in the proposed rule (89 FR 62473), we are finalizing the above measure(s) for addition to the *Preventive Medicine Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

¹⁰⁷² See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁷³ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

B.39. Pulmonology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Pulmonology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable.

B.39. Pulmonology

PREVIOUSLY FINALIZED MEASURES IN THE PULMONOLOGY SPECIALTY SET							
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title and Description	Measure Steward
* ! (Care Coordination)	0326 / N/A	047	N/A	Medicare Part B Claims Measure Specifications, MIPS CQM Specifications	Process	Advance Care Plan: Percentage of patients aged 65 years and older who have an advance care plan or surrogate decision maker documented in the medical record or documentation in the medical record that an advance care plan was discussed but the patient did not wish or was not able to name a surrogate decision maker or provide an advance care plan.	National Committee for Quality Assurance
	0102 / N/A	052	N/A	MIPS CQM Specifications	Process	Chronic Obstructive Pulmonary Disease (COPD): Spirometry Evaluation and Long-Acting Inhaled Bronchodilator Therapy: Percentage of patients aged 18 years and older with a diagnosis of COPD with a documented FEV1/FVC < 70% measured by spirometry, who are symptomatic and were prescribed a long-acting inhaled bronchodilator.	American Thoracic Society
* § ! (Patient Safety)	N/A / N/A	130	CMS68 v14	eCQM Specifications, MIPS CQM Specifications	Process	Documentation of Current Medications in the Medical Record: Percentage of visits for which the eligible clinician attests to documenting a list of current medications using all immediate resources available on the date of the encounter.	Centers for Medicare & Medicaid Services
§	N/A / N/A	226	CMS13 8v13	Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQM Specifications	Process	Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention: Percentage of patients aged 12 years and older who were screened for tobacco use one or more times during the measurement period AND who received tobacco cessation intervention during the measurement period or in the six months prior to the measurement period if identified as a tobacco user.	National Committee for Quality Assurance
* § ! (Outcome)	N/A / N/A	236	CMS16 5v13	Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQM Specifications	Intermediate Outcome	Controlling High Blood Pressure: Percentage of patients 18-85 years of age who had a diagnosis of essential hypertension starting before and continuing into, or starting during the first six months of the measurement period, and whose most recent blood pressure was adequately controlled (<140/90mmHg) during the measurement period.	National Committee for Quality Assurance

B.39. Pulmonology

* ! (Patient Safety)	0022 / N/A	238	CMS15 6v13	eCQM Specifications, MIPS CQM Specifications	Process	Use of High-Risk Medications in Older Adults: Percentage of patients 65 years of age and older who were ordered at least two high-risk medications from the same drug class.	National Committee for Quality Assurance
*	N/A / N/A	277	N/A	MIPS CQM Specifications	Process	Sleep Apnea: Severity Assessment at Initial Diagnosis: Percentage of patients aged 18 years and older with a diagnosis of obstructive sleep apnea who had an apnea hypopnea index (AHI), a respiratory disturbance index (RDI), or a respiratory event index (REI) documented or measured within 2 months after initial evaluation for suspected obstructive sleep apnea.	American Academy of Sleep Medicine
	N/A / N/A	279	N/A	MIPS CQM Specifications	Process	Sleep Apnea: Assessment of Adherence to Obstructive Sleep Apnea (OSA) Therapy: Percentage of patients aged 18 years and older with a diagnosis of obstructive sleep apnea (OSA) that were prescribed an evidence-based therapy that had documentation that adherence to therapy was assessed at least annually through an objective informatics system or through self-reporting (if objective reporting is not available).	American Academy of Sleep Medicine
* ! (Care Coordination)	N/A / N/A	374	CMS50 v13	eCQM Specifications, MIPS CQM Specifications	Process	Closing the Referral Loop: Receipt of Specialist Report: Percentage of patients with referrals, regardless of age, for which the referring clinician receives a report from the clinician to whom the patient was referred.	Centers for Medicare & Medicaid Services
! (Outcome)	N/A / N/A	398	N/A	MIPS CQM Specifications	Outcome	Optimal Asthma Control: Composite measure of the percentage of pediatric and adult patients whose asthma is well-controlled as demonstrated by one of three age appropriate patient reported outcome tools and not at risk for exacerbation.	Minnesota Community Measurement
§	2152 / N/A	431	N/A	MIPS CQM Specifications	Process	Preventive Care and Screening: Unhealthy Alcohol Use: Screening & Brief Counseling: Percentage of patients aged 18 years and older who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 12 months AND who received brief counseling if identified as an unhealthy alcohol user.	National Committee for Quality Assurance
! (Equity)	N/A / N/A	487	N/A	MIPS CQM Specifications	Process	Screening for Social Drivers of Health: Percent of patients 18 years and older screened for food insecurity, housing instability, transportation needs, utility difficulties, and interpersonal safety.	Centers for Medicare & Medicaid Services

B.40. Rheumatology

MEASURES FINALIZED FOR ADDITION TO THE RHEUMATOLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Rheumatology specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease. ¹⁰⁷⁶ Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations. ¹⁰⁷⁷ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.

We received public comments on the measure(s) proposed for addition to this specialty set. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed addition of the Adult COVID-19 Vaccination Status measure to this specialty set.

Response: We thank the commenter for supporting the addition of this measure to the Rheumatology specialty set.

¹⁰⁷⁶ See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁷⁷ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62482), we are finalizing the above measure(s) for addition to the *Rheumatology Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.41. Skilled Nursing Facility

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Skilled Nursing Facility specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable.

Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	<p>Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.</p>	Centers for Medicare & Medicaid Services	<p>We proposed to include this measure in the Skilled Nursing Facility specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease.¹⁰⁷⁸ Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations.¹⁰⁷⁹ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.</p>

We received no public comments on the measure(s) proposed for addition to this specialty set. For the reasons stated above and in the proposed rule (89 FR 62485), we are finalizing the above measure(s) for addition to the *Skilled Nursing Facility Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

¹⁰⁷⁸ See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁷⁹ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

B.42. Speech Language Pathology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Speech Language Pathology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable.

B.42. Speech Language Pathology

PREVIOUSLY FINALIZED MEASURES IN THE SPEECH LANGUAGE PATHOLOGY SPECIALTY SET							
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title and Description	Measure Steward
* § ! (Patient Safety)	N/A / N/A	130	CMS68 v14	eCQM Specifications, MIPS CQM Specifications	Process	Documentation of Current Medications in the Medical Record: Percentage of visits for which the eligible clinician attests to documenting a list of current medications using all immediate resources available on the date of the encounter.	Centers for Medicare & Medicaid Services
§	N/A / N/A	134	CMS2v 14	Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQM Specifications	Process	Preventive Care and Screening: Screening for Depression and Follow-Up Plan: Percentage of patients aged 12 years and older screened for depression on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of or up to two days after the date of the qualifying encounter.	Centers for Medicare & Medicaid Services
* ! (Patient Safety)	N/A / N/A	181	N/A	Medicare Part B Claims Measure Specifications, MIPS CQM Specifications	Process	Elder Maltreatment Screen and Follow-Up Plan: Percentage of patients aged 60 years and older with a documented elder maltreatment screen using an Elder Maltreatment Screening tool on the date of encounter AND a documented follow-up plan on the date of the positive screen.	Centers for Medicare & Medicaid Services
* § ! (Care Coordination)	N/A / N/A	182	N/A	MIPS CQM Specifications	Process	Functional Outcome Assessment: Percentage of visits for patients aged 18 years and older with documentation of a current functional outcome assessment using a standardized functional outcome assessment tool on the date of the encounter AND documentation of a care plan based on identified functional outcome deficiencies within two days of the date of the identified deficiencies.	Centers for Medicare & Medicaid Services
§	N/A / N/A	226	CMS13 8v13	Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQM Specifications	Process	Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention: Percentage of patients aged 12 years and older who were screened for tobacco use one or more times during the measurement period AND who received tobacco cessation intervention during the measurement period or in the six months prior to the measurement period if identified as a tobacco user.	National Committee for Quality Assurance

*	N/A / 2872e	281	CM S14 9v13	eCQM Specificati ons	Process	Dementia: Cognitive Assessment: Percentage of patients, regardless of age, with a diagnosis of dementia for whom an assessment of cognition is performed and the results reviewed at least once within a 12-month period.	American Academy of Neurology	We proposed to include this measure in the Speech Language Pathology specialty set as it would be clinically relevant to this clinician type. Speech language pathologists (SLPs) utilize standardized instruments with demonstrated reliability for dementia screening. These instruments typically assess orientation to time, place, and person. ¹⁰⁸⁰ Other tests (for example, story recall/story retelling) assess episodic memory and can be useful for screening early dementia. ¹⁰⁸¹ If screening reveals cognitive impairment, the individual is referred to an SLP for a comprehensive evaluation of communicative function. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. Appropriate coding was not included in the final specification; therefore, this measure is not being finalized for addition to this specialty measure set.

*	N/A / N/A	282	N/A	MIPS CQM Specifications	Process	<p>Dementia: Functional Status Assessment: Percentage of patients with dementia for whom an assessment of functional status was performed at least once in the last 12 months.</p>	American Academy of Neurology/ American Psychiatric Association	<p>We proposed to include this measure in the Speech Language Pathology specialty set as it will be clinically relevant to this clinician type. SLPs play a critical role in diagnosis and management of dysphagia in patients with dementia through comprehensive assessment, diet consistency modifications, educating their caregiver on the use of compensatory strategies, prescribing exercise programs, and referring them to other professionals as needed. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set.</p>

B.42. Speech Language Pathology

MEASURES FINALIZED AND NOT FINALIZED FOR ADDITION TO THE SPEECH LANGUAGE PATHOLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
* ! (Patient Safety)	N/A / N/A	286	N/A	MIPS CQM Specifications	Process	Dementia: Safety Concern Screening and Follow-Up for Patients with Dementia: Percentage of patients with dementia or their caregiver(s) for whom there was a documented safety concerns screening in two domains of risk: (1) dangerousness to self or others and (2) environmental risks; and if safety concerns screening was positive in the last 12 months, there was documentation of mitigation recommendations, including but not limited to referral to other resources.	American Psychiatric Association / American Academy of Neurology	We proposed to include this measure in the Speech Language Pathology specialty set as it will be clinically relevant to this clinician type. Dementia patients are at high risk for safety concerns due to underlying cognitive communication impairment which may impact judgment, reasoning, and memory as well as physical weakness resulting from other medical conditions. ¹⁰⁸² SLPs work directly with individuals with dementia and their caregivers to screen, assess, and establish care plans to address these issues through cognitive-communication exercises, use of compensatory strategies, environmental modifications, referrals to other professionals, and providing caregiver training. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set.

B.42. Speech Language Pathology

MEASURES FINALIZED AND NOT FINALIZED FOR ADDITION TO THE SPEECH LANGUAGE PATHOLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
* ! (Care Coordination)	N/A / N/A	288	N/A	MIPS CQM Specifications	Process	Dementia: Education and Support of Caregivers for Patients with Dementia: Percentage of patients with dementia whose caregiver(s) were provided with education on dementia disease management and health behavior changes AND were referred to additional resources for support in the last 12 months.	American Academy of Neurology / American Psychiatric Association	We proposed to include this measure in the Speech Language Pathology specialty set as it will be clinically relevant to this clinician type. SLPs provide information about the nature of dementia and its course of progression. SLPs make recommendations for environmental modifications, such as using alarms and pill boxes for medication reminders, visual aids, and provide education on communication strategies and modifications to caregiver behaviors to ensure the safety of the patient and compliance with the plan of care. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set.
* ! (Patient Experience)	N/A / N/A	386	N/A	MIPS CQM Specifications	Process	Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences: Percentage of patients diagnosed with Amyotrophic Lateral Sclerosis (ALS) who were offered assistance in planning for end of life issues (e.g., advance directives, invasive ventilation, lawful physician-hastened death, or hospice) or whose existing end of life plan was reviewed or updated at least once annually or more frequently as clinically indicated (i.e., rapid progression).	American Academy of Neurology	We proposed to include this measure in the Speech Language Pathology specialty set as it will be clinically relevant to this clinician type. Over the course of the disease, individuals with ALS exhibit difficulty producing intelligible speech to communicate basic needs and wants. ¹⁰⁸³ SLPs are trained to address communication deficits via exercise programs, use of communication strategies, and introducing augmentative and alternative communication (AAC) methods. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty measure set.

We received public comments on the measure(s) proposed for addition to this specialty set. The following is a summary of the comments we received and our responses.

¹⁰⁸³ National Institute of Neurological Disorders and Stroke. (2024). Amyotrophic Lateral Sclerosis. <https://www.ninds.nih.gov/health-information/disorders/amyotrophic-lateral-sclerosis-als>.

Comment: One commenter supported the proposed addition of measure Q281: Dementia: Cognitive Assessment, measure Q282: Dementia: Functional Status Assessment, measure Q286: Dementia: Safety Concern Screening and Follow-Up for Patients with Dementia, measure Q288: Dementia: Education and Support of Caregivers for Patients with Dementia, and measure Q386: Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences to this specialty set.

Response: We thank the commenter for supporting the addition of these measures to the Rheumatology specialty set.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 624 62488 through 62490), we are finalizing the above measure(s) for addition to the *Speech Language Pathology Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years: measures Q282, Q286, Q288, and Q386. Measure Q281 was not finalized for addition to this specialty set because applicable coding was not added for the measure to be reported by this specialty. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.43. Thoracic Surgery

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Thoracic Surgery specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set. This specialty set had no measures proposed for addition or removal. Measures with substantive changes as marked with an asterisk (*) are addressed under Table Group D.

B.44. Urgent Care

MEASURES FINALIZED FOR ADDITION TO THE URGENT CARE SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
*	N/A / N/A	488	CM S95 1v3	eCQM Specifications, MIPS CQM Specifications	Process	Kidney Health Evaluation: Percentage of patients aged 18-85 years with a diagnosis of diabetes who received a kidney health evaluation defined by an Estimated Glomerular Filtration Rate (eGFR) AND Urine Albumin-Creatinine Ratio (uACR) within the performance period.	National Kidney Foundation	We proposed to include this measure in the Urgent Care specialty set as it will be clinically relevant to this clinician type. This measure encourages an estimated glomerular filtration rate (eGFR) and urinary albumin-to-creatinine ratio (uACR) evaluation annually for patients diagnosed with diabetes. The measure aims for early detection which can reduce associated health risk of the comorbidities of diabetes and CKD. Having an established source of care is important in this high-risk population, however, in the general US population, approximately 15 percent of adults do not have a primary care physician. ¹⁰⁸⁴ According to the American Diabetes Association annual assessment of glomerular filtration rate (GFR) in adolescents, in addition to adults, with diabetes is necessary to appropriately screen for early diabetic nephropathy, and the assessment of GFR is essential to accurately diagnose diabetic kidney disease early in the disease process. ¹⁰⁸⁵ Including this measure in this specialty set could assist in capturing at-risk patients who may lack a primary care physician.

We received no public comments on the measure(s) proposed for addition to this specialty set. For the reasons stated above and in the proposed rule (89 FR 62497), we are finalizing the above measure(s) for addition to the *Urgent Care Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

The measure assesses individuals on a 0-100 scale that converts to one of four levels of activation, from low (1) to high (4). The PAM® performance measure (PAM®-PM) is the change in score on the PAM® from baseline to follow-up measurement.	Insignia Health, LLC, a wholly owned subsidiary of Phreesia

B.45. Urology

MEASURES FINALIZED FOR ADDITION TO THE UROLOGY SPECIALTY SET								
Indicator	CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Inclusion
	N/A / N/A	508	N/A	MIPS CQM Specifications	Process	Adult COVID-19 Vaccination Status: Percentage of patients aged 18 years and older seen for a visit during the performance period that are up to date on their COVID-19 vaccinations as defined by Centers for Disease Control and Prevention (CDC) recommendations on current vaccination.	Centers for Medicare & Medicaid Services	We proposed to include this measure in the Urology specialty set as it will be clinically relevant to this clinician type. Widespread vaccination against SARS-CoV-2, the virus that causes COVID-19, is critically important to stemming the morbidity and mortality caused by this disease. ¹⁰⁸⁶ Clinicians are uniquely positioned to encourage uptake of COVID-19 vaccination, and clinicians are still a major driving force in promoting patient vaccination. The addition of this quality measure in this specialty set will help strengthen compliance with recommended COVID-19 vaccination, leading to improvement in the quality of patient care and prevention of disease for the general population. This quality measure aligns with clinical guidelines and the evidence-based recommendations of the ACIP, where there is general agreement about the safety and efficacy of the COVID-19 vaccine, preventing costly and potentially harmful hospitalizations. ¹⁰⁸⁷ Broadening vaccination status awareness to this clinician type is valuable as it can help drive an increase in the adult vaccination rates. The COVID-19 vaccination included within this measure will reduce the prevalence of severe diseases that may be associated with hospitalization and decrease overall health care costs. The measure being added to this specialty set was contingent on the inclusion of applicable coding by the time of the CY 2025 PFS final rule. In the event appropriate coding was not included in the final specification, this measure would not have been finalized for inclusion within this specialty set. See Table A.5 of this Appendix for rationale, including clinical evidence supporting the inclusion of this measure in MIPS.

We received public comments on the measure(s) proposed for addition to this specialty set. The following is a summary of the comments we received and our responses.

Comment: One commenter opposed the proposed addition of the Adult COVID-19 Vaccination Status measure to the Urology specialty set as it is not clear why this vaccination status measure has been proposed for inclusion when other vaccination-focused measures have not.

¹⁰⁸⁶ See footnote Ikeokwu et al., 2023 in Table B.1 of this Appendix.

¹⁰⁸⁷ See footnotes Fitzpatrick et al., 2022; Polack et al., 2020; and Graña et al., 2022 in Table A.5 of this Appendix.

Response: We acknowledge the commenters concerns; however, MIPS eligible clinicians will not be required to report this measure because they have the flexibility to choose measures that are relevant and meaningful to their practice. This measure provides an opportunity to discuss vaccines with the patient. This measure represents an important clinical topic following the recently ended PHE for COVID-19. This process measure represents a CMS high priority clinical topic and fills a gap in MIPS by addressing COVID-19 vaccination status for all patients and ensuring clinician vaccination efforts at the point of care (for example, care for wellness and prevention against COVID-19). The COVID-19 vaccination is relevant for inclusion to the Urology specialty set because it is recommended for everyone 6 months and older including cancer patients who are at an increased risk for severe COVID-19. As a urologist's case mix may include cancer patients (for example, prostate and bladder cancers), it is in alignment with other measures within the specialty set. We acknowledge that other vaccinations are recommended for this patient population; however, cancer patients may be more vulnerable to COVID-19 related illness. Given the vaccination rate for COVID-19 is lower than the vaccination rate for other viruses, such as the vaccination rate for influenza, it is important to continue to drive administration, especially within the "at-risk" population.

For the reasons stated above and in the proposed rule (89 FR 62504), we are finalizing the above measure(s) for addition to the *Urology Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Where applicable, see Table Group A of this Appendix for any comments and responses pertaining to new measures that were proposed for addition to MIPS.

B.45. Urology

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE UROLOGY SPECIALTY SET							
Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.							
CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Removal
N/A / N/A	104	N/A	MIPS CQM Specifications	Process	Prostate Cancer: Combination Androgen Deprivation Therapy for High Risk or Very High Risk Prostate Cancer: Percentage of patients, regardless of age, with a diagnosis of prostate cancer at high or very high risk of recurrence receiving external beam radiotherapy to the prostate who were prescribed androgen deprivation therapy in combination with external beam radiotherapy to the prostate.	American Urological Association Education and Research	This measure was proposed for removal beginning with the CY 2025 performance period/2027 MIPS payment year. See Table Group C for rationale.
N/A / N/A	433	N/A	MIPS CQM Specifications	Outcome	Proportion of Patients Sustaining a Bowel Injury at the time of any Pelvic Organ Prolapse Repair: Percentage of patients undergoing surgical repair of pelvic organ prolapse that is complicated by a bowel injury at the time of index surgery that is recognized intraoperatively or within 30 days after surgery.	American Urogynecologic Society	This measure was proposed for removal beginning with the CY 2025 performance period/2027 MIPS payment year. See Table Group C for rationale.

We received public comments on the measure(s) proposed for removal from this specialty set. The following is a summary of the comments we received and our responses.

Comment: One commenter opposed the proposed removal of measure Q104 from the Urology specialty set and disagreed that the measure covers a limited patient population.

Response: We acknowledge the concerns expressed by the commenter. While we agree the concept is important to quality care, the removal of the measure does not preclude the quality action from continuing. Whether the clinician/group is being assessed for the quality action or not, it should still be completed as a matter of high-quality care. As mentioned in Table C.1 of this Appendix, the low adoption of this quality measure due to the complexity of reporting, resulting in a limited denominator eligible patient population, has not allowed for the creation of a benchmark. Additionally, when the measure was able to produce a benchmark in past performance periods it showed continued high performance, establishing this measure as a standard of care. By removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure's topped-out status would limit the score awarded per the benchmark files.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62505), we are finalizing the above measure(s) for removal from the *Urology Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Note: Where applicable, see Table Group C of this Appendix for any comments and responses pertaining to measures that were proposed for removal from MIPS.

B.46. Vascular Surgery

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this final rule, the Vascular Surgery specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines, and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures we are maintaining within the set, measures proposed to be added, and measures proposed for removal, as applicable.

OCHIN

B.46. Vascular Surgery

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE VASCULAR SURGERY SPECIALTY SET							
Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.							
CBE # / eCQM CBE #	Quality #	CMS eCQM ID	Collection Type	Measure Type	Measure Title And Description	Measure Steward	Rationale for Removal
NA / NA	260	N/A	MIPS CQM Specifications	Outcome	Rate of Carotid Endarterectomy (CEA) for Asymptomatic Patients, without Major Complications (Discharged to Home by Post-Operative Day #2): Percent of asymptomatic patients undergoing Carotid Endarterectomy (CEA) who are discharged to home no later than post-operative day #2.	Society for Vascular Surgery	This measure was proposed for removal beginning with the CY 2025 performance period/2027 MIPS payment year. See Table Group C for rationale.

We received no public comments on the measure(s) proposed for removal from this specialty set. For the reasons stated above and in the proposed rule (89 FR 62509), we are finalizing the above measure(s) for removal from the *Vascular Surgery Specialty Set* as proposed for the CY 2025 performance period/2027 MIPS payment year and future years. Note: Where applicable, see Table Group C of this Appendix for any comments and responses pertaining to measures that were proposed for removal from MIPS.

Table Group C: Previously Finalized Quality Measures Finalized and Not Finalized for Removal for the CY 2025 Performance Period/2027 MIPS Payment Year and Future Years

In this final rule, we are removing 10 of the 11 previously finalized MIPS quality measures proposed for removal for the CY 2025 performance period/2027 MIPS payment year and future years. These measures are discussed in detail in the removal tables below. We note measure Q436: Radiation Consideration for Adult CT: Utilization of Dose Lowering Techniques was already finalized for removal with a 1-year delay to the CY 2025 performance period as noted in the Table Group B introduction (89 FR 62268); therefore, measure Q436 does not have a removal table in this final rule and there are 10 removal tables under Table Group C.

The CY 2019 PFS final rule (83 FR 59763 through 59765) and CY 2020 PFS final rule (84 FR 62957 through 62959) discusses our incremental approach to removing process measures. Under section IV.A.4.e.(1)(d)(ii) of this final rule, removal criteria are being finalized at 414.1330(c).

NOTE: Since publication of the measures in Table Group C in the CY 2025 PFS proposed rule (89 FR 62509 through 62515), we have determined the following measure will be retained in the CY 2025 performance period/2027 MIPS payment year: Q144 as detailed under Table C.3 of this Appendix.

As noted in the introduction to Table Group B, measures that were not finalized for removal under Table Group C have been added back to the Previously Finalized tables, where applicable, and removed from the Removal tables, under the appropriate specialty set in Table Group B.

C.1. Prostate Cancer: Combination Androgen Deprivation Therapy for High Risk or Very High Risk Prostate Cancer

Category	Description
CBE# / eCQM CBE #:	N/A / N/A
Quality #:	104
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM Specifications
Measure Description:	Percentage of patients, regardless of age, with a diagnosis of prostate cancer at high or very high risk of recurrence receiving external beam radiotherapy to the prostate who were prescribed androgen deprivation therapy in combination with external beam radiotherapy to the prostate.
Measure Steward:	American Urological Association Education and Research
High Priority Measure:	No
Measure Type:	Process
Rationale for Removal:	We proposed the removal of this quality measure from MIPS (finalized in 81 FR 77558 through 77675) because the limited patient population as well as adoption of this quality measure does not allow for the creation of a benchmark. For more information on benchmarks, see the MIPS 2024 Quality Benchmarks User Guide https://www.cms.gov/files/document/2024-quality-benchmarks-user-guide-scoring-examples-pdf.pdf . The current 2024 MIPS benchmarking data is located at https://qpp.cms.gov/benchmarks .
In the Circumstance the Measure Was Retained:	There were no substantive changes or specialty set movement proposed for this measure. If the measure was not finalized for removal in the CY 2025 PFS final rule, it would have been added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would have been addressed under Table Group C of this Appendix.

We received public comments on the proposed removal of this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed removal of measure Q104: Prostate Cancer: Combination Androgen Deprivation Therapy for High Risk or Very High Risk Prostate Cancer.

Response: We thank the commenter for supporting the removal of this measure from MIPS.

Comment: One commenter opposed removal of measure Q104 because it focuses on a “must-do” clinical process linked to overall survival over many years, as supported by multiple randomized controlled trials. While the commenter acknowledged the low uptake of the measure, they disagreed with CMS that it covers a limited patient population and noted the American Cancer Society recently reported an increase in incidence of advanced-stage disease for prostate cancer (<https://pressroom.cancer.org/FactsandFigures23>), making this measure even more relevant for urologists and others who provide care to those with prostate cancer. A second commenter did not support the removal of measure Q104.

Response: While we agree the measure concept is important to quality care, the removal of the measure does not preclude the quality action from continuing. Whether the clinician/group is being assessed for the quality action or not, it should still be completed as a matter of high-quality care. As mentioned above, the low adoption of this quality measure due to complexity of reporting, resulting in a limited denominator eligible patient population, has not allowed for the creation of a benchmark. Additionally, when the measure was able to produce a benchmark in past performance periods it showed continued high performance, establishing this as a standard of care. By removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure’s topped-out status would limit the score awarded per the benchmark files.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62510), we are finalizing the removal of measure Q104 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

C.2. Melanoma: Continuity of Care – Recall System

Category	Description
CBE# / eCQM CBE #:	N/A / N/A
Quality #:	137
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM Specifications
Measure Description:	Percentage of patients, regardless of age, with a current diagnosis of melanoma or a history of melanoma whose information was entered, at least once within a 12 month period, into a recall system that includes: <ul style="list-style-type: none"> • A target date for the next complete physical skin exam, AND • A process to follow up with patients who either did not make an appointment within the specified timeframe or who missed a scheduled appointment.
Measure Steward:	American Academy of Dermatology
High Priority Measure:	Yes
Measure Type:	Structure
Rationale for Removal:	We proposed the removal of this quality measure from MIPS (finalized in 81 FR 77558 through 77675) because this measure is duplicative of the Melanoma: Tracking and Evaluation of Recurrence measure being proposed in Table A.6 of this Appendix. Measure Q137 establishes a recall system linked to the process of notifying patients, with a current diagnosis or history of melanoma, when their next physical exam is due, as well as to follow up with patients who did not make an appointment within the specified timeframe or who missed a scheduled appointment. It does not assess whether the patient completed an annual skin exam nor if the process to follow up for those patients who missed an appointment is effective. The new measure proposed in Table A.6 of this Appendix is a process measure that not only assesses a significantly similar patient population, but also assesses patients who had excisional surgery for melanoma or melanoma in situ in the past 5 years for completion of an exam and/or diagnosed for recurrence of melanoma. The new measure provides a more meaningful impact to quality improvement for this patient population.
In the Circumstance the Measure Was Retained:	There were no substantive changes or specialty set movement proposed for this measure. If the measure was not finalized for removal in the CY 2025 PFS final rule, it would have been added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would have been addressed under Table Group C of this Appendix.

We received public comments on the proposed removal of this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed removal of measure Q137: Melanoma: Continuity of Care – Recall System.

Response: We thank the commenter for supporting the removal of this measure from MIPS.

Comment: One commenter did not support the removal of measure Q137 because the new measure Melanoma: Tracking and Evaluation of Recurrence under Table A.6 of this Appendix seemed more in-depth and complex. The commenter indicated the new measure is limited to the operating clinician who completes the excisional surgery, which in many cases is not the clinician who follows up with the patients for regular skin exams and had concerns of who would be responsible for tracking and reporting the new measure. The commenter requested clarification on whether CMS would use numerator criteria 1 or numerator criteria 2 for the scoring of the new measure, stating their concern that data completeness would be hard to meet as they do not want to diagnose 20+ melanoma recurrences for each MIPS eligible clinician annually. The commenter suggested instead of removing measure Q137 that CMS drop measure Q137 to the 7-point threshold for topped-out measures so it can still be reported.

Response: We thank the commenter for their feedback and acknowledge that this measure addresses a critical element in ensuring patients receive annual follow-up appointments. We agree that in many cases the clinician who follows up with a patient who has had excisional surgery may not be the same clinician who performed the procedure. The measure does allow for the surgeon to utilize medical record documentation to determine numerator compliance and measure performance. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years. Based on the comments received, we recognize that this measure represents an important component in early identification of recurrence for melanoma that will drive timely and appropriate care. The Dermatology specialty set does not meet the threshold, which is 75 percent of available quality achievement points, to be considered ‘at-risk’; therefore, this measure does not meet the criteria to be reviewed for possible 7-point cap removal (89 FR 62079). As such, the measure will not allow clinicians to reach maximum points for their quality score.

Comment: One commenter stated the new measure is not duplicative of measure Q137. Measure Q137 ensures the necessary infrastructure is in place for scheduling follow-up exams for melanoma patients, complementing the new measure that tracks the occurrence of these exams. Retaining measure Q137 addresses different aspects of patient care and supports dermatologists in participating in MIPS with a relevant, specialty-specific measure that is not topped out, enhancing quality improvement and positive patient outcomes.

Response: Both the new measure proposed in Table A.6 of this Appendix and measure Q137 assess a similar patient population with a diagnosis or history of melanoma. As noted earlier, while measure Q137 establishes a recall system linked to the process of notifying patients, when their next physical exam is due, as well as follows up with patients who did not make an appointment within the specified timeframe or who missed a scheduled appointment, it does not assess whether the patient completed an annual skin exam. In addition, the new proposed measure assesses patients who had excisional surgery for melanoma or melanoma in situ in the past 5 years for completion of an exam and if they're diagnosed for recurrence of melanoma. It is important to ensure duplicative measures are removed from MIPS to develop an ecosystem of quality measures that drive value-based care.

Comment: One commenter opposed removal of measure Q137 due to the complexity and potential unintended consequences of the proposed measure. The proposed measure introduces a level of depth and complexity that may prove prohibitive for many clinicians, potentially leading to a reduction in the quality of care for the melanoma patient population. Without the existing structured recall system in place, there is a considerable risk that patients may experience a higher incidence of melanoma recurrence due to lapses in follow-up care. To address this concern, the commenter requested that CMS consider lowering the threshold for measure Q137 to the 7-point threshold for topped-out measures.

Response: It is important to ensure duplicative measures are removed from MIPS to develop an ecosystem of quality measures that drive value-based care. This measure was previously included within MIPS as a QCDR measure and was shown to be implementable. We encourage clinicians to provide care as they determine best supports all patients during their healthcare journey even if the patient population is not included within the targeted denominator of a given measure specification. This measure does not meet the criteria to have the 7-point cap removed and as such, will not allow for clinicians to reach maximum allowed points for their quality score.

Comment: One commenter opposed removal of measure Q137, stating that the type of data currently being used by practices to satisfy this measure is difficult to translate to the new proposed measure. The American Joint Committee on Cancer (AJCC) staging references (<https://www.facs.org/quality-programs/cancer-programs/american-joint-committee-on-cancer/cancer-staging-systems/>) are usually documented in PDF files, rather than in structured text that can be easily mapped to EHR fields. As a result, identifying the appropriate denominator population for the new proposed measure would be very challenging for practices. In addition, the commenter indicated that the 5-year lookback period for the new Melanoma: Tracking and Evaluation of Recurrence measure could further complicate accurate denominator calculations due to transitions between EHR systems. When practices switch to new EHR systems, historical data from the previous EHR is often retained as PDF attachments rather than as structured data fields. The commenter also noted that dermatology has limited benchmarked quality measures and urged CMS to take this into account and maintain sufficient specialty-specific MIPS quality measures.

Response: We thank the commenter for their feedback. The intent of this measure overlaps with the new measure proposed in Table A.6 of this Appendix, leading to the positive outcome of determining recurrence in a timely manner. Coding within the new measure specification would allow clinicians to map their system to identify the appropriate patient population which includes patients with an excisional surgery for melanoma or melanoma in situ in the past 5 years with an initial AJCC Staging of 0, I, or II. Removal of measure Q137 does not preclude clinicians from continued use of a recall system which enables providers to ensure that patients receive follow-up appointments in accordance with their individual needs. We recognize that due to nuances in clinician specialization, scope of care, or regional location, not all measures within MIPS will be applicable or appropriate to all clinicians within that specialty.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62510), we are finalizing the removal of measure Q137 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

C.3. Oncology: Medical and Radiation – Plan of Care for Pain

Category	Description
CBE# / eCQM CBE #:	0383 / N/A
Quality #:	144
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM Specifications
Measure Description:	Percentage of visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy who report having pain with a documented plan of care to address pain.
Measure Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Process
Rationale for Removal:	We proposed the removal of this quality measure from MIPS (finalized in 81 FR 77558 through 77675) because this measure is duplicative of measure Q143: Oncology: Medical and Radiation – Pain Intensity Quantified. Measure Q143 specifically questions cancer patients, currently receiving chemotherapy or radiation therapy, to quantify their pain intensity at each visit using a standardized tool. This measure is more robust than measure Q144 as it encourages the clinician to initiate a discussion regarding pain intensity with the patient at every denominator eligible visit. Measure Q144 is narrower in scope focusing on cancer patients identified with pain. To identify this patient population, a clinician will still need to screen their patients. Measure Q143 promotes screening of a broader patient population for pain, which still allows clinicians to administer care if pain is present. Additionally, measure Q143 is available for reporting within the eCQM collection type, allowing clinicians more measure options if reporting via eCQMs.
In the Circumstance the Measure Was Retained:	There were no substantive changes or specialty set movement proposed for this measure. If the measure was not finalized for removal in the CY 2025 PFS final rule, it would have been added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would have been addressed under Table Group C of this Appendix.

We received public comments on the proposed removal of this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed removal of measure Q144: Oncology: Medical and Radiation – Plan of Care for Pain.

Response: We thank the commenter for supporting the removal of this measure from MIPS.

Comment: A number of commenters opposed the removal of measure Q144 from MIPS. Key opposition to removing the measure was that measure Q144 is not duplicative of, but rather paired with, Q143: Oncology: Medical and Radiation – Pain Intensity Quantified. Commenters indicated the measures should be implemented sequentially to achieve a comprehensive clinical quality outcome, with measure Q143 confirming that the patient's pain was evaluated and measure Q144 validating that a patient care plan for pain was developed based on that assessment. The intent is for clinicians to report on both measures as a unit, while resulting in individual measure scores.

Commenters also indicated that both measures were recently re-endorsed by the CBE as part of its Fall 2023 Endorsement and Maintenance cycle, and the observed performance rates of measure Q144 from the 2019-2021 performance periods indicate opportunity for improvement at both the individual clinician and practice level. One commenter recommended that measures Q143 and Q144 be combined into one combined measure. Additional reasons that commenters cited for opposing the removal of measure Q144 included: it would cause misalignment with CMMI's Enhancing Oncology Model (<https://www.cms.gov/priorities/innovation/innovation-models/enhancing-oncology-model>); the measure strengthens the Advancing Cancer Care MVP under Appendix 3, Table B.2; it would be difficult to meet MIPS reporting requirements under traditional MIPS or MVPs for practices limited by their EHR's quality measure selection; practices would need to train staff on new workflows for quality measures; and pain management and improvement in pain are top health care priorities.

Response: The measure steward is currently evaluating respecifying measures Q143 and Q144 into a single, combined measure and requested that both measures be retained at this time. We encourage the commenters to work with the measure steward as these measures are considered for revision.

Based on the potential for revision to these measures in future rulemaking, and after consideration of public comments, we are not finalizing the removal of measure Q144 as proposed for the CY 2025 performance period/2027 MIPS payment year. Therefore, the measure has been added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix. If the measure is not combined for CY2026, we will revisit the removal of measure Q144 for the CY2026 performance period/2028 MIPS payment year and future years.

C.4. Ultrasound Determination of Pregnancy Location for Pregnant Patients with Abdominal Pain

Category	Description
CBE# / eCQM CBE #:	N/A / N/A
Quality #:	254
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM Specifications
Measure Description:	Percentage of pregnant female patients aged 14 to 50 who present to the emergency department (ED) with a chief complaint of abdominal pain or vaginal bleeding who receive a trans-abdominal or trans-vaginal ultrasound to determine pregnancy location.
Measure Steward:	American College of Emergency Physicians
High Priority Measure:	No
Measure Type:	Process
Rationale for Removal:	We proposed the removal of this quality measure from MIPS (finalized in 81 FR 77558 through 77675) because this measure has reached the end of the topped-out lifecycle (82 FR 53640) and has a limited opportunity to improve clinical outcomes. Topped-out process measures are those with a median performance rate of 95 percent or higher (81 FR 77286). ¹⁰⁸⁸ This measure's continued topped-out status is based on the current 2024 MIPS benchmarking data located at https://qpp.cms.gov/benchmarks , in addition to previous years MIPS benchmarking data. For more information on benchmarks, see the MIPS 2024 Quality Benchmarks User Guide at https://www.cms.gov/files/document/2024-quality-benchmarks-user-guide-scoring-examples-pdf.pdf .
In the Circumstance the Measure Was Retained:	There were no substantive changes or specialty set movement proposed for this measure. If the measure was not finalized for removal in the CY 2025 PFS final rule, it would have been added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would have been addressed under Table Group C of this Appendix.

We received public comments on the proposed removal of this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed removal of measure Q254: Ultrasound Determination of Pregnancy Location for Pregnant Patients with Abdominal Pain.

Response: We thank the commenter for supporting the removal of this measure from MIPS.

Comment: One commenter requested that CMS retain topped out measures proposed for removal, such as measure Q254. The commenter urged CMS to work with interested parties to come up with a reasonable solution for maintaining measures with a median performance rate of 95 percent or higher, whether it is (a) subjecting them to the newly proposed defined topped out measure benchmark; (b) maintaining them as pay-for-reporting measures (which would allow a clinician to continue to earn points and track performance even if they are not being scored on performance); or, (c) some other innovative solution to ensure high performance on these measures is monitored and maintained over time.

Response: We thank the commenter for their feedback. However, the data shows the measure has reached the end of its topped-out life cycle, which does not allow meaningful benchmarks to be established. Additionally, by removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure's topped out status would limit the score awarded per the 2024 Benchmark File. Under the finalized methodology for determining which specialty measure sets may be considered 'at-risk', the Emergency Medicine specialty set does not meet the 'at-risk' threshold, which is 75 percent of available quality achievement points; therefore, this measure does not meet the criteria to be reviewed for possible 7-point cap removal (89 FR 62079).

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62511), we are finalizing the removal of measure Q254 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹⁰⁸⁸ See the 2024 MIPS Call for Measures Fact Set: <https://qpp-cm-prod-content.s3.amazonaws.com/uploads/2711/2024-MIPS-Call-for-Measures-and-Activities.zip>.

C.5. Rate of Carotid Endarterectomy (CEA) for Asymptomatic Patients, without Major Complications (Discharged to Home by Post-Operative Day #2):

Category	Description
CBE# / eCQM CBE #:	N/A / N/A
Quality #:	260
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM Specifications
Measure Description:	Percent of asymptomatic patients undergoing Carotid Endarterectomy (CEA) who are discharged to home no later than post-operative day #2.
Measure Steward:	Society for Vascular Surgery
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale for Removal:	We proposed the removal of this quality measure from MIPS (finalized in 81 FR 77558 through 77675) because this measure will be duplicative of measure Q344: Rate of Carotid Artery Stenting (CAS) for Asymptomatic Patients, Without Major Complications (Discharged to Home by Post-Operative Day #2) if the proposed changes to the measure are finalized. We proposed in Table D.34 of this Appendix substantive changes to measure Q344, which describe the inclusion of the measure concept represented in Q260. Measure Q260 is focused on performing CEA on asymptomatic patients who are at low risk for morbidity and therefore are expected to have very low complication rates as indicated by patients being discharged to home by post-operative day #2. As a result, we proposed to maintain measure Q344 and remove measure Q260 from MIPS.
In the Circumstance the Measure Was Retained:	There were no substantive changes or specialty set movement proposed for this measure. If the measure was not finalized for removal in the CY 2025 PFS final rule, it would have been added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would have been addressed under Table Group C of this Appendix.

We received public comments on the proposed removal of this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed removal of measure Q260: Rate of Carotid Endarterectomy (CEA) for Asymptomatic Patients, without Major Complications (Discharged to Home by Post-Operative Day #2).

Response: We thank the commenter for supporting the removal of this measure from MIPS.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62511 through 62512), we are finalizing the removal of measure Q260 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

C.6. Clinical Outcome Post Endovascular Stroke Treatment

Category	Description
CBE# / eCQM CBE #:	N/A / N/A
Quality #:	409
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM Specifications
Measure Description:	Percentage of patients with a Modified Rankin Score (mRS) score of 0 to 2 at 90 days following endovascular stroke intervention.
Measure Steward:	Society of Interventional Radiology
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale for Removal:	We proposed the removal of this quality measure from MIPS (finalized in 81 FR 77558 through 77675) at the measure steward's request as it is no longer being maintained for inclusion.
In the Circumstance the Measure Was Retained:	There were no substantive changes or specialty set movement proposed for this measure. If the measure was not finalized for removal in the CY 2025 PFS final rule, it would have been added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would have been addressed under Table Group C of this Appendix.

We received public comments on the proposed removal of this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed removal of measure Q409: Clinical Outcome Post Endovascular Stroke Treatment.

Response: We thank the commenter for supporting the removal of this measure from MIPS.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62512), we are finalizing the removal of measure Q409 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

C.7. Proportion of Patients Sustaining a Bowel Injury at the time of any Pelvic Organ Prolapse Repair

Category	Description
CBE# / eCQM CBE #:	N/A / N/A
Quality #:	433
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM Specifications
Measure Description:	Percentage of patients undergoing surgical repair of pelvic organ prolapse that is complicated by a bowel injury at the time of index surgery that is recognized intraoperatively or within 30 days after surgery.
Measure Steward:	American Urogynecologic Society
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale for Removal:	We proposed the removal of this quality measure from MIPS (finalized in 81 FR 77558 through 77675) because this measure will be duplicative of measure Q432: Proportion of Patients Sustaining a Bladder Injury at the Time of any Pelvic Organ Prolapse Repair, if the proposed changes to the measure are finalized. We proposed in Table D.46 of this Appendix substantive changes to measure Q432, which describe the inclusion of the measure concept represented in measure Q433. In addition, we proposed to update the measure title and description for measure Q432 to include patients who sustain a bowel injury at the time of any pelvic organ prolapse repair.
In the Circumstance the Measure Was Retained:	There were no substantive changes or specialty set movement proposed for this measure. If the measure was not finalized for removal in the CY 2025 PFS final rule, it would have been added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would have been addressed under Table Group C of this Appendix.

We received public comments on the proposed removal of this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed removal of measure Q433: Proportion of Patients Sustaining a Bowel Injury at the time of any Pelvic Organ Prolapse Repair.

Response: We thank the commenter for supporting the removal of this measure from MIPS.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62513), we are finalizing the removal of measure Q433 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

C.8. Age Appropriate Screening Colonoscopy

Category	Description
CBE# / eCQM CBE #:	N/A / N/A
Quality #:	439
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM Specifications
Measure Description:	The percentage of screening colonoscopies performed in patients greater than or equal to 86 years of age from January 1 to December 31.
Measure Steward:	American Gastroenterological Association
High Priority Measure:	Yes
Measure Type:	Efficiency
Rationale for Removal:	We proposed the removal of this quality measure from MIPS (finalized in 81 FR 77558 through 77675) because the quality action being measured has become standard of care, based upon MIPS performance data, and thus has limited opportunity to improve clinical outcomes. Performance on this measure is extremely high and unvarying, making this measure extremely topped out as discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763). The average performance for this inverse measure is 0.15 percent for the MIPS CQM collection type. For an inverse measure, a lower calculated performance rate indicates better clinical care or control. As such, the MIPS CQM collection type is considered extremely topped out. The average performance rate is based on the current 2024 MIPS benchmarking data located at https://qpp.cms.gov/benchmarks . For more information on benchmarks, see the MIPS 2024 Quality Benchmarks User Guide at https://www.cms.gov/files/document/2024-quality-benchmarks-user-guide-scoring-examples-pdf.pdf .
In the Circumstance the Measure Was Retained:	There were no substantive changes or specialty set movement proposed for this measure. If the measure was not finalized for removal in the CY 2025 PFS final rule, it would have been added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would have been addressed under Table Group C of this Appendix.

We received public comments on the proposed removal of this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed removal of measure Q439: Age Appropriate Screening Colonoscopy.

Response: We thank the commenter for supporting the removal of this measure from MIPS.

Comment: Two commenters opposed removal of measure Q439. The commenters did not believe MIPS performance data is an accurate assessment to determine whether this measure was topped out and stated that CMS' analysis was insufficient to make the determination. CMS' analysis was based on one year of benchmarking data following the substantive changes made to the measure specification in PY2022. The amount of time to verify the extremely topped-out status should be based on multiple years, not one performance year cycle, and no other multi-year data was used to validate the topped-out status or extremely topped-out status, which typically occurs over multiple performance year cycles. Furthermore, the commenters stated that measure Q439 has been designated by CMS as a high-priority measure and as the only colorectal cancer screening measure that specifically addresses the vulnerable population of older adults.

The commenters indicated that measure Q439 is one of six measures included in the GIQuIC qualified clinical data registry (QCDR) measure set, three of which are QPP measures and three of which are GIQuIC QCDR measures. It is the six quality measures that make up the GIQuIC QCDR measure set that balance the only specialty-specific cost measure included in the candidate GI Care MVP, the Screening/Surveillance Colonoscopy episode-based cost measure. The commenters requested that this measure be given an appropriate glidepath for removal, so gastroenterologists have time to determine an alternative meaningful measure on which to assess their practice and report.

Response: While we agree that the intent of measure Q439 is to encourage age-appropriate colonoscopy screenings, this measure is extremely topped out which further demonstrates that age-appropriate colonoscopies have become a standard of care. Our analysis was sufficient in determining that this measure was topped out because both a historical benchmark for PY2024 and a performance period benchmark for PY2023 was produced showing extremely topped out performance in both instances. Additionally, removal of this measure leaves a sufficient number of measures available, 13, within the gastroenterology specialty set. This measure was previously proposed for removal for the CY 2023 performance period/2025 MIPS payment year due to low adoption, however, we did not remove it at that time based on comments received including the request to maintain the measure for two years to ascertain performance based upon the measure revisions requested (see 87 FR 70541). The updated measure specification has been available for use in MIPS for multiple years and has continued to demonstrate extremely high performance. Removal allows eligible clinicians to maximize their potential quality performance score as this measure's topped out status would limit the score awarded per the 2024 Benchmark File. While this measure was updated for PY2022, both an historical benchmark for PY2024 and a performance period benchmark for PY2023 was produced showing extremely topped out performance in both instances. We encourage the GIQuIC QCDR to adopt alternate quality measures or develop new quality measures to ensure a robust offering for their clients.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62513), we are finalizing the removal of measure Q439 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

C.9. Patients with Metastatic Colorectal Cancer and RAS (KRAS or NRAS) Gene Mutation Spared Treatment with Anti-epidermal Growth Factor Receptor (EGFR) Monoclonal Antibodies

Category	Description
CBE# / eCQM CBE #:	1860 / N/A
Quality #:	452
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM Specifications
Measure Description:	Percentage of adult patients (aged 18 or over) with metastatic colorectal cancer and RAS (KRAS or NRAS) gene mutation spared treatment with anti-EGFR monoclonal antibodies.
Measure Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Process
Rationale for Removal:	<p>We proposed the removal of this quality measure from MIPS (finalized in 81 FR 77558 through 77675) because this measure is duplicative of measure Q451: RAS (KRAS and NRAS) Gene Mutation Testing Performed for Patients with Metastatic Colorectal Cancer who Receive Anti-epidermal Growth Factor Receptor (EGFR) Monoclonal Antibody Therapy. Measures Q451 and Q452 ask the same clinical question but approach questioning from different clinical perspectives. Measure Q451 assesses patients who have already received anti-EGFR monoclonal therapy to determine if they received RAS gene mutation testing prior to initiation of therapy, while measure Q452 is a standard-of-care measure, as well as the counter clinical perspective to measure Q451. Measure Q452 only evaluates for patients who received anti-EGFR monoclonal treatment. Therefore, measure Q452 is a component of the quality action within measure Q451. The molecular biomarkers for the evaluation of colorectal cancer guidelines¹⁰⁸⁹ strongly recommend “Patients with colorectal carcinoma being considered for anti-EGFR therapy must receive RAS mutational testing,” which is the standard of care being evaluated by this measure.</p> <p>Measure Q451 provides an opportunity for a retrospective review and has the potential to improve clinical outcomes. For example, if the performance rates show there is a gap in medical care or high incidence of initiating therapy without first testing for the RAS gene mutation, clinical processes can be revised to improve practice. “Clinical care review is the process of retrospectively examining potential errors or gaps in medical care, with a goal of future practice improvement.”¹⁰⁹⁰</p>
In the Circumstance the Measure Was Retained:	<p>If the measure was not finalized for removal in the CY 2025 PFS final rule, we proposed to apply the following substantive changes to the measure specifications: (1) add denominator instructions to clarify the denominator eligible timeframe for diagnosis and (2) only patients who have been newly diagnosed with Stage IV colorectal cancer, or patients who have distant metastases at the time of colon cancer diagnosis, are to be included in the denominator of the measure to ensure the appropriate patient population is assessed for the numerator action.</p> <p>If the measure was not finalized for removal in the CY 2025 PFS final rule, it would have been added back into the applicable previously finalized specialty set(s) under Table Group B and the reason for its retention would have been addressed under Table Group C. The substantive changes outlined above will be applied to the measure specifications.</p>

We received public comments on the proposed removal of this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed removal of measure Q452: Patients with Metastatic Colorectal Cancer and RAS (KRAS or NRAS) Gene Mutation Spared Treatment with Anti-epidermal Growth Factor Receptor (EGFR) Monoclonal Antibodies.

Response: We thank the commenter for supporting the removal of this measure from MIPS.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62514), we are finalizing the removal of measure Q452 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

C.10. Appropriate Use of DXA Scans in Women Under 65 Years Who Do Not Meet the Risk Factor Profile for Osteoporotic Fracture

Category	Description
CBE# / eCQM CBE #:	N/A / 3475e
Quality #:	472
CMS eCQM ID:	CMS249v7
Collection Type:	eCQM Specifications
Measure Description:	Percentage of female patients 50 to 64 years of age without select risk factors for osteoporotic fracture who received an order for a dual-energy x-ray absorptiometry (DXA) scan during the measurement period.
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale for Removal:	We proposed the removal of this quality measure from MIPS (finalized in 83 FR 60104 through 60105) because the quality action being measured has become standard of care, based upon MIPS performance data, and thus has limited opportunity to improve clinical outcomes. Performance on this measure is extremely high and unvarying, making this measure extremely topped out as discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763). The average performance for this inverse measure is 1.1 percent for the eCQM collection type. For an inverse measure, a lower calculated performance rate indicates better clinical care or control. As such, the eCQM collection type is considered extremely topped out. The average performance rate is based on the current 2024 MIPS benchmarking data located at https://qpp.cms.gov/benchmarks . For more information on benchmarks, see the MIPS 2024 Quality Benchmarks User Guide at https://www.cms.gov/files/document/2024-quality-benchmarks-user-guide-scoring-examples-pdf.pdf .
In the Circumstance the Measure Was Retained:	There were no substantive changes or specialty set movement proposed for this measure. If the measure was not finalized for removal in the CY 2025 PFS final rule, it would have been added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would have been addressed under Table Group C of this Appendix.

We received public comments on the proposed removal of this measure. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed removal of measure Q472: Appropriate Use of DXA Scans in Women Under 65 Years Who Do Not Meet the Risk Factor Profile for Osteoporotic Fracture. One of these commenters agreed with the proposed removal of this measure, particularly given that it is topped out.

Response: We thank the commenters for supporting the removal of this measure from MIPS.

Comment: One commenter did not support the removal of measure Q472. The commenter was concerned about the significant number of measure removals from certain specialties and urged CMS to be mindful when removing multiple measures from specialties so as to ensure sufficient measures remain in MIPS that are pertinent to those specialties

Response: We acknowledge that removal of this measure decreases the number of available measures for certain specialists; however, there are policies in place, such as Eligible Measure Applicability (EMA) and denominator reduction to account for this when working to meet MIPS quality performance category requirements. Additionally, these nuances are considered when reviewing the MIPS quality measure inventory.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62515), we are finalizing the removal of measure Q472 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

Table Group D: Finalized Substantive Changes to Previously Finalized MIPS Quality Measures for the CY 2025 Performance Period/2027 MIPS Payment Year and Future Years

The D Tables within this final rule provide the substantive changes finalized for the MIPS quality measures in CY 2025. We note that some MIPS quality measures available in traditional MIPS and MVPs are adopted by the Medicare Shared Savings Program for utilization in the Alternative Payment Model (APM) Performance Pathway (APP) and/or APP Plus, as finalized in section IV.A.4.c.(3) of this final rule. For such measures, the collection type applicable for purposes of the APP and/or APP Plus (Medicare CQM for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare CQM)) is also specified as a collection type available for such measures described in Table Group D.

The changes that are made to the denominator codes sets are generalizations of the revisions communicated from the measure stewards to CMS. Additionally, International Classification of Diseases Tenth Edition (ICD-10) and Current Procedural Terminology (CPT) codes that are identified as invalid for CY 2025 may not be identified within this final rule due to the availability of these changes to the public. If coding revisions to the denominator are impacted due to the timing of 2025 CPT and ICD-10 updates and assessment of these codes' inclusion by the Measure Steward, these changes may be postponed until CY 2026. The 2025 Quality Measure Release Notes provide a comprehensive, detailed reference of exact code changes to the denominators of the quality measures. The Quality Measure Release Notes are available for each of the collection types in the Quality Payment Program website at <https://qpp.cms.gov>. In addition, eCQMs that are endorsed by a CBE are shown in Table D of this Appendix as follows: CBE # / eCQM CBE #.

In addition to the finalized substantive changes, there may be changes to the coding utilized within the denominator that are not considered substantive in nature, but they are important to communicate to interested parties. These changes align with the scope of the current coding; however, though not substantive in nature, these changes will expand or contract the measure's current eligible population. Therefore, please refer to the current year measure specification and the 2025 Quality Measure Release Notes or the eCQM Technical Release Notes once posted to review all coding changes to ensure correct implementation. Language has also been added, to all applicable 2025 quality measure specifications, in the form of an 'Instructions Note' to clarify that telehealth encounters are allowed for determination of denominator eligibility. Only where telehealth encounters previously were not allowed as denominator eligible will the D table corresponding to a measure reflect an update to the denominator allowing for telehealth encounters in the 'Substantive Change' cell.

The eCQM Technical Release Notes should also be carefully reviewed for revisions within the logic portion of the measure. In addition to the finalized substantive changes, there may be revisions within the logic that are not considered substantive in nature, however, it is important to review to ensure proper implementation of the measure. As not all systems and clinical workflows are the same, it is important to review these changes in the context of a specific system and/or clinical workflow.

D.1. Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%)

Category	Description
CBE # / eCQM CBE #:	0059 / N/A
Quality #:	001
CMS eCQM ID:	CMS122v13
Current Collection Type:	Medicare Part B Claims Measure Specifications/ eCQM Specifications/ MIPS CQM Specifications/ Medicare CQM Specifications (collection type available only in the APP and/or APP Plus)
Current Measure Description:	Percentage of patients 18-75 years of age with diabetes who had hemoglobin A1c > 9.0% during the measurement period.
Substantive Change:	<p>The measure title is revised from “Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%)” to: Diabetes: Glycemic Status Assessment Greater Than 9%.</p> <p>The measure description is revised to read: For all collection types: Percentage of patients 18-75 years of age with diabetes who had a glycemic status assessment (hemoglobin A1c [HbA1c] or glucose management indicator [GMI]) > 9.0% during the measurement period.</p> <p>Updated denominator exclusion: For all collection types: Removed: specific encounter requirements from the frailty/advanced illness exclusion.</p> <p>The measure numerator is revised to read: For all collection types: Patients whose most recent glycemic status assessment (HbA1c or GMI) (performed during the measurement period) is > 9.0% or is missing, or was not performed during the measurement period.</p> <p>Updated guidance: For the eCQM Specifications collection type: Revised: If the glycemic status assessment (HbA1c or GMI) is in the medical record, the test can be used to determine numerator compliance.</p> <p>Added: Glycemic status assessment (HbA1c or GMI) must be reported as a percentage (%). If multiple glycemic status assessments were recorded for a single date, use the lowest result.</p> <p>Updated numerator instructions: For the MIPS CQM Specifications and the Medicare Part B Claims Measure Specifications collection types: Added: GMI as an assessment option.</p> <p>Updated numerator options: For the MIPS CQM Specifications and the Medicare Part B Claims Measure Specifications collection types: Added: GMI as an assessment option.</p> <p>Updated numerator note: For the MIPS CQM Specifications and the Medicare Part B Claims Measure Specifications collection types: Added: If multiple glycemic status assessments were recorded for a single date, use the lowest result.</p>
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale	<p>We proposed to revise this measure to include glucose management indicators (GMI) to broaden the acceptable methods for monitoring the glycemic status of patients with diabetes. This measure revision supports those clinicians that are using this monitoring method to ensure management of persons with diabetes using continuous glucose monitoring.¹⁰⁹¹</p> <p>We also proposed to update the denominator exclusion by removing the requirement for patients to have had at least one inpatient or two outpatient encounters to recognize a diagnosis of advanced illness. The removal of this requirement within the denominator exclusion reduces the burden of identifying applicable encounters, while still identifying patients with an indication of frailty. This is particularly applicable for those patients seen outside of their reporting clinician’s medical record. This revision will update the denominator exclusion to remove any patient 66 years of age and older who has a diagnosis of advanced illness during the measurement period or the year prior from the denominator of measure Q001. Decreasing complexity and burden of this element ensures consistent implementation allowing for more comparable data.</p>

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to the frailty exclusion criteria to measure Q001: Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%). The removal of the encounter criteria will reduce reporting burden while still following through with the intent of the exclusion for patients with an indication of frailty. A second commenter appreciated the proposed substantive changes proposed to this measure.

¹⁰⁹¹ ElSayed, N. A., Aleppo, G., Aroda, V. R., Bannuru, R. R., Brown, F. M., Bruemmer, D., Collins, B. S., Hilliard, M. E., Isaacs, D., Johnson, E. L., Kahan, S., Khunti, K., Leon, J., Lyons, S. K., Perry, M. L., Prahalad, P., Pratley, R. E., Seley, J. J., Stanton, R. C., Gabbay, R. A., ... on behalf of the American Diabetes Association (2023). 7. Diabetes Technology: Standards of Care in Diabetes-2023. *Diabetes Care*, 46(Suppl 1), S111–S127. <https://doi.org/10.2337/dc23-S007>.

Response: We thank the commenters for supporting the substantive changes to this measure.

Comment: One commenter supported the proposed substantive changes exclusion because aggressive glycemic control may not be appropriate for all older adults, especially those with advanced illness. A second commenter appreciated the proposed substantive changes to update the measure title and specifications, per revised HEDIS specifications, so that it now includes glycemic status indicator (GMI). However, the commenter requested clarification regarding how the exclusions for frailty and/or advanced illness will work at an operational level in medical clinics. The commenter questioned whether these exclusions occur automatically based on claims, and if so, how will CMS communicate the exclusions back to each patient's clinician?

Response: To meet the exclusion for frailty and/or advanced illness, the measure still requires patients 66 years of age and older to have at least one claim/encounter for frailty during the measurement period AND an advanced illness diagnosis during the measurement period or the year prior to the measurement period. As noted above, removal of the additional requirement for patients to have had either one inpatient or two outpatient encounters to recognize a diagnosis of advanced illness reduces the burden of identifying applicable encounters, while still identifying patients with an indication of frailty. When submitting this measure, the clinician would report on patients based upon the information within the medical record in accordance with the current measure specification. The update to the denominator exclusion does not change how the measure data may be captured and reported only the criteria to determine whether a patient is appropriate for the quality action assessment.

If reporting via the Medicare Part B Claims Measure collection type, the exclusion is factored into the calculation of the measure based upon the information submitted on the claim(s) forms in accordance with the measure specification. However, if reporting via MIPS CQM or eCQM collection types, the MIPS eligible clinician would be required to meet the measure requirements as posted and ensure the patient's medical record substantiates all data submitted. While eCQM collection type is specific to data abstraction from the electronic health record as a data source, MIPS CQM collection type is constructed to be instructional for use within any data source available, and how a system is mapped to pull the information, as specified, is at the discretion of the reporting clinician/group.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62517), we are finalizing the changes to measure Q001 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.2. Anti-Depressant Medication Management

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	009
CMS eCQM ID:	CMS128v13
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of patients 18 years of age and older who were treated with antidepressant medication, had a diagnosis of major depression, and who remained on an antidepressant medication treatment. Two rates are reported. a. Percentage of patients who remained on an antidepressant medication for at least 84 days (12 weeks). b. Percentage of patients who remained on an antidepressant medication for at least 180 days (6 months).
Substantive Change:	The measure initial patient population is revised to read: Patients 18 years of age and older as of the IPSD who were dispensed antidepressant medications during the Intake Period, and were diagnosed with major depression 60 days prior to, or 60 days after the dispensing event and had a visit 60 days prior to, or 60 days after the dispensing event. Updated logic and logic definition: Revised: logic to base it on age and IPSD.
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to revise the initial patient population look-back window to evaluate the age of the patient when medication is dispensed during the intake period. The updated timeframe distinguishes between a new prescription and a continuing prescription to ensure the measure logic is more accurate in determining the antidepressant treatment has met the numerator's quality action. We also proposed to update the logic to look at the age and IPSD so that the look-back window allows all patients to be assessed for the exclusion criteria related to previous anti-depression medication.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62518), we are finalizing the changes to measure Q009 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.3. Diabetic Retinopathy: Communication with the Physician Managing Ongoing Diabetes Care

Category	Description
CBE # / eCQM CBE #:	N/A/ N/A
Quality #:	019
CMS eCQM ID:	CMS142v13
Current Collection Type:	eCQM Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of diabetic retinopathy who had a dilated macular or fundus exam performed with documented communication to the physician who manages the ongoing care of the patient with diabetes mellitus regarding the findings of the macular or fundus exam at least once during the performance period.
Substantive Change:	<p>Modified collection type: eCQM Specifications collection type.</p> <p>Updated Guidance: Revised: The communication of results, including the level of severity of diabetic retinopathy and presence or absence of macular edema to the primary care physician providing ongoing care of a patient's diabetes should be completed soon after the dilated exam is performed.</p>
Measure Steward:	American Academy of Ophthalmology
High Priority Measure:	Yes
Measure Type:	Process
Rationale	<p>We proposed to remove the MIPS CQM collection type as it has reached the end of the topped-out lifecycle (82 FR 53640). The average performance rate and topped-out status is based on the current MIPS benchmarking data located at https://app.cms.gov/benchmarks. However, the benchmarking data continues to show a gap for the eCQM collection type and as such, we proposed to retain that collection type.</p> <p>Additionally, we proposed to revise the measure guidance to define required information to be included within the report for the purposes of numerator compliance. This ensures all appropriate information is being communicated for patient care coordination.</p>

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter opposed the proposed substantive changes to remove the MIPS CQM collection type to measure Q019: Diabetic Retinopathy: Communication with the Physician Managing Ongoing Diabetes Care.

Response: We acknowledge the commenter’s concerns; however, the MIPS CQM collection type has not only reached the end of the topped-out life cycle, but it also showed an average performance rate of 100 percent which does not allow for meaningful benchmarks to be established.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62518), we are finalizing the changes to measure Q019 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.4. Advance Care Plan

Category	Description
CBE # / eCQM CBE #:	0326 / N/A
Quality #:	047
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Specifications, MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 65 years and older who have an advance care plan or surrogate decision maker documented in the medical record or documentation in the medical record that an advance care plan was discussed but the patient did not wish or was not able to name a surrogate decision maker or provide an advance care plan.
Substantive Change:	Updated the denominator criteria: For the MIPS CQM Specifications and the Medicare Part B Specifications collection types: Added: coding for neuropsychology.
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update denominator criteria to include coding for neuropsychology as this measure is applicable to their scope of care.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q047: Advance Care Plan but requested clarification regarding whether these revisions apply only for MIPS or whether they apply across all payers and programs. The commenter indicated that measure specification changes and reporting mechanisms should align across all payers and programs.

Response: We thank the commenter for their supporting the substantive changes to this measure. The revisions in this final rule apply only to MIPS; however, we strive to align measures across programs where possible.

After considerations of public comments, and for the reasons stated above and in the proposed rule (89 FR 62519), we are finalizing the changes to measure Q047 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.5. Diabetes: Eye Exam

Category	Description
CBE # / eCQM CBE #:	0055 / N/A
Quality #:	117
CMS eCQM ID:	CMS131v13
Current Collection Type:	eCQM Specifications/ MIPS CQM Specifications
Current Measure Description:	Percentage of patients 18-75 years of age with diabetes and an active diagnosis of retinopathy in any part of the measurement period who had a retinal or dilated eye exam by an eye care professional during the measurement period or diabetics with no diagnosis of retinopathy in any part of the measurement period who had a retinal or dilated eye exam by an eye care professional during the measurement period or in the 12 months prior to the measurement period.
Substantive Change:	Updated denominator exclusion: For all collection types: Removed: specific encounter requirements from the frailty/advanced illness exclusion.
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the denominator exclusion by removing the requirement for patients to have had at least one inpatient or two outpatient encounters to recognize a diagnosis of advanced illness. The removal of this requirement within the denominator exclusion reduces the burden of identifying applicable encounters, while still identifying patients with an indication of frailty. This is particularly applicable for those patients seen outside of their reporting clinician’s medical record. This revision will update the denominator exclusion to remove any patient 66 years of age and older who has a diagnosis of advanced illness during the measurement period or the year prior from the denominator of measure Q117. Decreasing complexity and burden of this element ensures consistent implementation allowing for more comparable data.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the proposed substantive changes to update to the frailty exclusion to measure Q117: Diabetes: Eye Exam. The commenters agreed this update will make it easier and less burdensome to capture the intended patient population for this measure.

Response: We thank the commenters for supporting the substantive changes to this measure.

Comment: One commenter supported the proposed substantive changes to this measure but requested clarification regarding how the clinician will know when their patient went somewhere else and obtained a frailty and/or advanced illness diagnosis which then removes them from the clinician’s denominator.

Response: We thank the commenter for supporting the substantive changes to this measure. As noted above, removal of the additional requirement for patients to have had either one inpatient or two outpatient encounters to recognize a diagnosis of advanced illness reduces the burden of identifying applicable encounters, while still identifying patients with an indication of frailty. We encourage clinicians to provide care as they determine best supports all patients during their healthcare journey. When submitting this measure, the clinician would report on patients based upon the information within the medical record in accordance with the current measure specification. The update to the denominator exclusion does not change how the measure data may be captured and reported only the criteria to determine whether a patient is appropriate for the quality action assessment.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62519), we are finalizing the changes to measure Q117 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.6. Documentation of Current Medications in the Medical Record

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	130
CMS eCQM ID:	CMS68v14
Current Collection Type:	eCQM Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of visits for patients aged 18 years and older for which the eligible clinician attests to documenting a list of current medications using all immediate resources available on the date of the encounter.
Substantive Change:	<p>The measure description is revised to read: For all collection types: Percentage of visits for which the eligible clinician attests to documenting a list of current medications using all immediate resources available on the date of the encounter.</p> <p>Updated guidance: For the eCQM specifications collection type: Revised: allows for documentation to be completed on the day of the encounter.</p> <p>Updated initial patient population: For the eCQM specifications collection type: Removed: age criteria.</p> <p>Updated denominator: For the MIPS CQM Specifications collection type: Removed: age criteria.</p> <p>Updated denominator criteria: For the MIPS CQM Specifications collection type: Removed: age criteria.</p> <p>Added: coding for pediatric audiology services.</p> <p>Updated numerator note: For the MIPS CQM Specifications collection type: Revised: allows for documentation to be completed on the day of the encounter.</p>
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale	<p>We proposed to update multiple components of the measure to remove the age criteria so that all patients, regardless of age, are assessed for having a list of their current medications documented in their medical record. This revision broadens the denominator, supporting assessment of current medications for all patient age ranges. Assessing for missing information about the dosage, route, or frequency of a medication supports clinical communication and may assist in avoiding patient harm.¹⁰⁹²</p> <p>Additionally, we proposed to update the measure to allow for the quality action to occur on the day of the encounter rather than limiting to during the encounter. This will allow for flexibility to align with the clinician's workflows and systems.</p> <p>We also proposed to update the denominator criteria to include coding for pediatric audiology services as this measure is applicable to their scope of care.</p>

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed substantive changes to measure Q130: Documentation of Current Medications in the Medical Record. One commenter supported the proposed modification to the timing of the numerator action to allow practices to perform quality actions on the encounter day rather than solely during the encounter itself. If finalized, the commenter requested that CMS ensure qualified registries can map to a date stamp, thereby verifying that the quality action took place on the encounter day.

Response: We thank the commenters for supporting the substantive changes to this measure. Prior to selecting or using any third party intermediary or its products, the individual clinician, group, virtual group, subgroup, and/or APM Entity should perform their own due diligence on the intermediary and its products to ensure congruency in workflow and data transfer. It is incumbent upon MIPS eligible clinicians to ensure the accuracy of their data.

Comment: One commenter appreciated the proposed substantive changes to measure Q130 but requested clarification regarding whether a nurse can complete the documentation. Additionally, the commenter encouraged CMS to consider scenarios such as when a clinician may complete a medication reconciliation the day after an encounter (rather than same day), as often occurs when clinicians work to catch up on their documentation. With this scenario in mind, the commenter encouraged CMS to expand the timeframe so that the documentation may occur beyond the actual day of the encounter. The commenter also acknowledged that this measure is a "check box" measure.

¹⁰⁹² Owen, M. C., Chang, N. M., Chong, D. H., & Vawdrey, D. K. (2011). Evaluation of Medication List Completeness, Safety, and Annotations. *AMIA Annual Symposium Proceedings. AMIA Symposium, 2011*, 1055–1061. <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3243276/>.

Response: We thank the commenter for their feedback. The measure does not dictate a clinician's workflow and which clinical staff, such as a nurse, may complete the documentation of current medications. However, the MIPS eligible clinician must attest to documenting, updating, or reviewing the patient's current medications to meet the measures quality action. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62520), we are finalizing the changes to measure Q130 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.7. Oncology: Medical and Radiation – Pain Intensity Quantified

Category	Description
CBE # / eCQM CBE #:	0384 / 0384e
Quality #:	143
CMS eCQM ID:	CMS157v13
Current Collection Type:	eCQM Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of patient visits, regardless of patient age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy in which pain intensity is quantified.
Substantive Change:	Updated initial patient population: For the eCQM Specifications collection type: Revised: Population 1: All patient visits, regardless of patient age, with a diagnosis of cancer currently receiving chemotherapy. Population 2: All patient visits, regardless of patient age, with a diagnosis of cancer currently receiving radiation therapy.
Measure Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to revise this measure to split the initial patient population to delineate between patients who are receiving radiation therapy and are assessed for pain intensity and their pain level quantified. This additional patient population will allow clinicians reporting this measure the ability to distinguish their performance between patients receiving chemotherapy and those receiving radiation services. It will also align the measure across all collection types.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Two commenters opposed the proposed substantive changes to measure Q143: Oncology: Medical and Radiation – Pain Intensity Quantified to split the initial population to distinguish between patients who receive chemotherapy and patients who receive radiation therapy. The commenters sought clarification from CMS on whether the intent of this proposed change is to have a multi strata measure or two separate measures. This measure is comprised of two patient populations, but it is intended to result in one reporting rate. Pain is one of the most common and debilitating symptoms reported amongst cancer patients, and both chemotherapy and radiation specifically are associated with several distinct pain syndromes. Splitting this patient population into two populations resulting in two performance rates would essentially create two different measures, and the intent of the measure is to encompass both therapies into one rate to comprehensively assess pain in cancer patients. The commenters believed the division of one measure into two contradicts CMS policy, which seeks to restrict the number of measures pertaining to specific subjects and populations.

Response: As noted, the split in the initial population is intended to allow clinicians the ability to distinguish their performance between patients receiving chemotherapy and those receiving radiation therapy. This is not a change in how the measure is implemented, but rather a clarification that allows the logic in the eCQM collection type to better identify the patients who are receiving either chemotherapy or radiation. The measure will remain a single measure with a single performance rate for the purposes of benchmarking. This also better aligns the eCQM and MIPS CQM collection types.

As noted under Table C.3 of this Appendix, the measure steward is currently evaluating a proposal to respecify measures Q143 and Q144: Oncology: Medical and Radiation – Plan of Care for Pain into a single, combined measure. The measure steward can evaluate whether it would be appropriate to split the measure into separate medical oncology and radiation oncology measures. The request was to keep two separate measures pending their revision.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62521), we are finalizing the changes to measure Q143 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.8. Falls: Plan of Care

Category	Description
CBE # / eCQM CBE #:	0101 / N/A
Quality #:	155
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Measure Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 65 years and older with a history of falls who had a plan of care for falls documented within 12 months.
Substantive Change:	Modified collection type: MIPS CQM Specifications collection type.
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to revise this measure by removing the Medicare Part B Claims Measure collection type for this measure as it has reached the end of the topped-out lifecycle (82 FR 53640). The average performance rate is based on the current 2024 MIPS benchmarking data located at https://qpp.cms.gov/benchmarks .

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed substantive changes to measure Q155: Falls: Plan of Care.

Response: We thank the commenters for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62521), we are finalizing the changes to measure Q155 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.9. Coronary Artery Bypass Graft (CABG): Surgical Re-Exploration

Category	Description
CBE # / eCQM CBE #:	0115 / N/A
Quality #:	168
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 18 years and older undergoing isolated CABG surgery who require a return to the operating room (OR) during the current hospitalization for mediastinal bleeding with or without tamponade, graft occlusion, valve dysfunction, or other cardiac reason.
Substantive Change:	<p>The measure description is revised to read: Percentage of patients aged 18 years and older undergoing isolated CABG surgery who require a return to the operating room (OR) for mediastinal bleeding with or without tamponade, unplanned coronary artery intervention (native vessel, graft or both), valve dysfunction, aortic reintervention or other cardiac reason during the current hospitalization.</p> <p>The measure numerator is revised to read: Patients undergoing isolated CABG surgery who require a return to the OR for mediastinal bleeding with or without tamponade, unplanned coronary artery intervention (native vessel, graft or both), valve dysfunction, aortic reintervention or other cardiac reason during the current hospitalization.</p> <p>Updated numerator options: Added: unplanned coronary artery intervention (native vessel, graft, or both) and aortic reintervention</p>
Measure Steward:	Society of Thoracic Surgeons
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale	We proposed to revise this measure to broaden the scope of cardiac complications that may require a return to the operating room following isolated CABG surgery. These revisions support the measure to decrease surgical re-exploration following CABG surgery, which is a serious complication and impacts length of stay, efficient use of resources, and increases risk for additional injury and death. ¹⁰⁹³ Although rates of re-exploration after cardiac surgery have significantly declined recently, it has been linked to much higher complications, mortality, and hospitalizations. ¹⁰⁹⁴

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q168: Coronary Artery Bypass Graft (CABG): Surgical Re-Exploration that broaden the scope of cardiac complications that may require a return to the operating room following isolated CABG surgery. The commenter supported these revisions aiming to decrease surgical re-exploration following CABG surgery. Surgical re-exploration following a CABG surgery is a serious complication and impacts risk of mortality, new-onset renal failure, and increased blood use, which may adversely affect long-term survival. Although rates of re-exploration after cardiac surgery have significantly declined recently, it has been linked to much higher complications, mortality, and hospitalizations.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62522), we are finalizing the changes to measure Q168 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

Trends and Outcomes of Surgical Reexploration After Cardiac Operations in the United States. *The Annals of Thoracic Surgery*, 113(3), 783–792. <https://doi.org/10.1016/j.athoracsur.2021.04.011>.

¹⁰⁹⁴ See footnote Tran et al., 2022.

D.10. Tuberculosis Screening Prior to First Course of Biologic and/or Immune Response Modifier Therapy

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	176
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	If a patient has been newly prescribed a biologic and/or immune response modifier that includes a warning for potential reactivation of a latent infection, then the medical record should indicate TB testing in the preceding 12-month period.
Substantive Change:	Updated denominator instructions: Added: new biosimilar medications.
Measure Steward:	American College of Rheumatology
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the list of medications by adding new biosimilar medications to the existing list in the denominator instructions. This expansion will provide an up-to-date list of appropriate biologics and/or immune response modifiers that clinicians may have prescribed for their patients, thereby ensuring that the right patients are identified in the denominator of this measure. These targeted immunotherapies are associated with a high risk of progression to active TB infection, therefore screening for latent TB prior to initiating first course therapy is highly recommended since it has been shown to effectively reduce the incidence of progression in patients with latent TB. ¹⁰⁹⁵

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to include new biosimilar medications to measure Q176: Tuberculosis Screening Prior to First Course of Biologic and/or Immune Response Modifier Therapy as requested. A second commenter also supported the substantive changes to this measure and requested that CMS clearly communicate a comprehensive list of the additional biosimilar medications that will be added to this measure by December 2024. The commenter noted this information was not included in this proposed rule and practices will need time to implement these changes.

Response: We thank the commenters for supporting the substantive changes to this measure. The list of additional biosimilar medications is included in the measure specifications that will be posted mid December 2024.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62523), we are finalizing the changes to measure Q176 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹⁰⁹⁵ CDC. (2020). Latent Tuberculosis Infection – A Guide for Primary Health Care Providers. <https://www.cdc.gov/tb/media/pdfs/Latent-TB-Infection-A-Guide-for-Primary-Health-Care-Providers.pdf>

D.11. Rheumatoid Arthritis (RA): Periodic Assessment of Disease Activity

Category	Description
CBE # / eCQM CBE #:	2523 / N/A
Quality #:	177
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of rheumatoid arthritis (RA) who have an assessment of disease activity using an ACR-preferred RA disease activity assessment tool at $\geq 50\%$ of encounters for RA for each patient during the measurement year.
Substantive Change:	<p>The measure description is revised to read: Percentage of patients aged 18 years and older with two or more diagnoses of rheumatoid arthritis (RA) at least 90 days apart who have an assessment of disease activity using an ACR-preferred RA disease activity assessment tool at $\geq 50\%$ of encounters for RA for each patient during the performance period.</p> <p>The measure denominator is revised to read: Patients aged 18 years and older with two or more RA diagnoses documented at least 90 days apart with at least one encounter with an RA diagnosis occurring during the performance period and an additional encounter with an RA diagnosis occurring in the performance period or prior performance period.</p> <p>Updated denominator definition: Added: Encounter – An encounter during the performance period where one of the CPT or HCPCS codes listed in the patient encounter criteria is used without a telehealth modifier (i.e., only non-telehealth visits are to be considered for this measure).</p> <p>Additional encounter - An additional encounter during the performance period or prior performance period where one of the CPT or HCPCS codes listed in the patient encounter is used to confirm an RA diagnosis with ICD-10-CM diagnosis codes as listed in the Denominator criteria.</p> <p>Updated denominator criteria: Added: An additional encounter with an RA diagnosis during the performance period or prior performance period that is at least 90 days before or after an encounter with an RA diagnosis during the performance period.</p> <p>Updated numerator definition: Revised: A result within the valid range of the selected tool qualifies for meeting numerator performance as long as a result is captured at $\geq 50\%$ of each patient's qualified encounters. If the result of a recorded disease activity assessment is outside the valid range of scores for the tool (e.g., a CDAI score of 101 when the maximum possible score is 76.0) or is only recorded as a disease activity level (e.g., low, moderate, or high) in place of a calculated numerical score, this score should not be included in the count to meet the $\geq 50\%$ requirement in the numerator.</p>
Measure Steward:	American College of Rheumatology
High Priority Measure:	No
Measure Type:	Process
Rationale	<p>We proposed to revise the denominator to provide greater specificity on the timeframe and criteria for denominator coding and how it should be captured to ensure the appropriate patients are being identified for this measure. Diagnosing RA requires “a combination of physical exams, blood tests for inflammatory markers, and imaging tests (like X-rays and MRIs), in addition to patient-reported symptoms,” which can take multiple visits to determine an accurate assessment of RA disease activity.¹⁰⁹⁶ Therefore, this change will align more closely with the workflow of clinicians and allows the assessment of a patient for RA disease activity during more than one clinical visit. These changes support a comprehensive perspective of the patient's disease activity level and should promote optimal treatment outcomes.</p> <p>We proposed to revise the definition for 'Assessment of Disease Activity' to confirm that only those assessments where the disease activity is correctly recorded are included in the numerator quality action for the purposes of meeting performance. Not only do the results need to be within the range of the selected validated qualifying tool, but also a calculated numeric score and not simply a disease activity level. This will ensure that all assessment information is correctly captured to drive appropriate care.</p>

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to the numerator and denominator to measure Q177: Rheumatoid Arthritis (RA): Periodic Assessment of Disease Activity.

¹⁰⁹⁶ Brody, B. (2020). The American College of Rheumatology Updated Its Approved Disease Activity Measures for Rheumatoid Arthritis — Here's What That Means. <https://creakyjoints.org/living-with-arthritis/symptoms/approved-disease-activity-measures-for-rheumatoid-arthritis/>.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62524), we are finalizing the changes to measure Q177 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.12. Rheumatoid Arthritis (RA): Functional Status Assessment

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	178
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of rheumatoid arthritis (RA) for whom a functional status assessment was performed at least once within 12 months.
Substantive Change:	<p>The measure description is revised to read: Percentage of patients aged 18 years and older with two or more diagnoses of rheumatoid arthritis (RA) at least 90 days apart for whom a functional status assessment was performed at least once during the performance period.</p> <p>The measure denominator is revised to read: Patients aged 18 years and older with two or more RA diagnoses documented at least 90 days apart with at least one encounter with an RA diagnosis occurring during the performance period and an additional encounter with an RA diagnosis occurring in the performance period or prior performance period.</p> <p>Updated denominator definition: Added: Encounter – An encounter during the performance period where one of the CPT or HCPCS codes listed in the patient encounter criteria is used.</p> <p>Additional encounter – An additional encounter during the performance period or prior performance period where one of the CPT or HCPCS codes listed in the patient encounter is used to confirm an RA diagnosis with ICD-10-CM diagnosis codes as listed in the Denominator criteria.</p> <p>Updated denominator criteria: Added: an additional encounter with an RA diagnosis during the performance period or prior performance period that is at least 90 days before or after an encounter with an RA diagnosis during the performance period.</p>
Measure Steward:	American College of Rheumatology
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to revise the denominator to provide greater specificity on the timeframe and criteria for denominator coding and how it should be captured to ensure the appropriate patients are being identified for this measure. Diagnosing RA requires “a combination of physical exams, blood tests for inflammatory markers, and imaging tests (like X-rays and MRIs), in addition to patient-reported symptoms,” which can take multiple visits to determine an accurate assessment of RA disease activity. ¹⁰⁹⁷ Therefore, this change will align more closely with the workflow of clinicians and allows assessment of a patient for RA disease activity during more than one clinical visit. These changes support a comprehensive perspective of the patient’s disease activity level and should promote optimal treatment outcomes.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to the denominator to measure Q178: Rheumatoid Arthritis (RA): Functional Status Assessment.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62525), we are finalizing the changes to measure Q178 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹⁰⁹⁷ See footnote Brody, 2020 in Table D.11 of this Appendix.

D.13. Rheumatoid Arthritis (RA): Glucocorticoid Management

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	180
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of rheumatoid arthritis (RA) who have been assessed for glucocorticoid use and, for those on prolonged doses of prednisone > 5 mg daily (or equivalent) with improvement or no change in disease activity, documentation of glucocorticoid management plan within 12 months.
Substantive Change:	<p>The measure description is revised to read: Percentage of patients aged 18 years and older with two or more diagnoses of rheumatoid arthritis (RA) at least 90 days apart who have been assessed for glucocorticoid use and, for those on prolonged doses of prednisone >5 mg daily (or equivalent) with improvement or no change in disease activity, documentation of glucocorticoid management plan during the performance period.</p> <p>The measure denominator is revised to read: Patients aged 18 years and older with two or more RA diagnoses documented at least 90 days apart with at least one encounter with an RA diagnosis occurring during the performance period and an additional encounter with an RA diagnosis occurring in the performance period or prior performance period.</p> <p>Updated denominator definition: Added: Encounter – An encounter during the performance period where one of the CPT or HCPCS codes listed in the patient encounter criteria is used.</p> <p>Additional encounter -- An additional encounter during the performance period or prior performance period where one of the CPT or HCPCS codes listed in the patient encounter is used to confirm an RA diagnosis with ICD-10-CM diagnosis codes as listed in the Denominator criteria.</p> <p>Updated denominator criteria: Added: An additional encounter with an RA diagnosis during the performance period or prior performance period that is at least 90 days before or after an encounter with an RA diagnosis during the performance period.</p>
Measure Steward:	American College of Rheumatology
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to revise the denominator to provide greater specificity on the timeframe and criteria for denominator coding and how it should be captured to ensure the appropriate patients are being identified for this measure. Diagnosing RA requires “a combination of physical exams, blood tests for inflammatory markers, and imaging tests (like X-rays and MRIs), in addition to patient-reported symptoms,” which can take multiple visits to determine an accurate assessment of RA disease activity. ¹⁰⁹⁸ Therefore, this change will align more closely with the workflow of clinicians and allows assessment of a patient for RA disease activity during more than one clinical visit. These changes support a comprehensive perspective of the patient’s disease activity level and should promote optimal treatment outcomes.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to the denominator to measure Q180: Rheumatoid Arthritis (RA): Glucocorticoid Management.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62526), we are finalizing the changes to measure Q180 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹⁰⁹⁸ See footnote Brody, 2020 in Table D.11 of this Appendix.

D.14. Elder Maltreatment Screen and Follow-Up Plan

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	181
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Measure Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 60 years and older with a documented elder maltreatment screen using an Elder Maltreatment Screening tool on the date of encounter AND a documented follow-up plan on the date of the positive screen.
Substantive Change:	Updated denominator criteria: For all collection types: Added: coding for emergency department.
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to add encounter codes for emergency department (ED) visits to the denominator criteria as the emergency department is an appropriate setting for screening for elder maltreatment. "EDs are a potentially important setting for elder mistreatment identification because they provide care for a large number of older adults who may be elder mistreatment victims" especially given that the ED is sometimes the only clinical setting that the patient may visit. ¹⁰⁹⁹ Expanding the denominator to include ED visits ensures a more complete denominator patient population and provides support and delivery of interventions that could prevent actual abuse.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed substantive changes for measure Q181: Elder Maltreatment Screen and Follow-up Plan. One commenter supported adding encounter codes for ED visits to the denominator. The commenter agreed that the ED is a prime setting for elder maltreatment identification and follow-up planning.

Response: We thank the commenters for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62527), we are finalizing the changes to measure Q181 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹⁰⁹⁹ See footnote Rosen et al., 2020 in Table B.11 of this Appendix.

D.15. Functional Outcome Assessment

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	182
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of visits for patients aged 18 years and older with documentation of a current functional outcome assessment using a standardized functional outcome assessment tool on the date of the encounter AND documentation of a care plan based on identified functional outcome deficiencies within two days of the date of the identified deficiencies.
Substantive Change:	<p>Updated numerator definition: Revised: Functional Outcome Assessment: Patient completed questionnaires designed to measure a patient's limitations in performing the usual human tasks of living and to directly quantify functional and behavioral symptoms. If a patient is unable to complete a questionnaire, a standardized clinical assessment tool may be used to measure a patient's limitations.</p> <p>Added: To Table 1. Definitions for Magnitude of Effects, Based on Mean Between-Group Differences – Modified*: clarification that list of standardized tools is not exhaustive.</p>
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update the numerator definition to clarify that clinicians may use a standardized clinical assessment tool to measure a patient's limitation if they are unable to complete a questionnaire. This change will allow flexibility in performing the quality action and clarify that the list of standardized tools named in the measure are only examples, not an exhaustive list. The National Institute of Health indicates that it supports the use of standardized tools, stating they offer a clinician-designed approach to promoting care standardization that accommodates patients' individual differences, respects clinicians' clinical judgement, and keeps pace with the rapid growth of medical knowledge. ¹¹⁰⁰

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed substantive changes to measure Q182: Functional Outcome Assessment.

Response: We thank the commenters for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62528), we are finalizing the changes to measure Q182 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹⁰⁰ Farias, M., Jenkins, K., Lock, J., Rathod, R., Newburger, J., Bates, D. W., Safran, D. G., Friedman, K., & Greenberg, J. (2013). Standardized Clinical Assessment and Management Plans (SCAMPs) Provide a Better Alternative to Clinical Practice Guidelines. *Health Affairs (Project Hope)*, 32(5), 911–920. <https://doi.org/10.1377/hlthaff.2012.0667>.

D.16. Colonoscopy Interval for Patients with a History of Adenomatous Polyps – Avoidance of Inappropriate Use

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	185
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 18 years and older receiving a surveillance colonoscopy, with a history of prior adenomatous polyp(s) in previous colonoscopy findings, which had an interval of 3 or more years since their last colonoscopy.
Substantive Change:	Updated denominator exception: Added: To the 'Documentation of system reasons(s): patient cannot provide precise date or details from previous colonoscopy.
Measure Steward:	American Gastroenterological Association
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update the denominator exception to exclude patients that are unable to provide the precise date or details from a previous colonoscopy. This addition will assist with data collection when a patient with a history of adenomatous polyps is unable to provide information regarding their last colonoscopy.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62529), we are finalizing the changes to measure Q185 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.17. Controlling High Blood Pressure

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	236
CMS eCQM ID:	CMS165v13
Current Collection Type:	Medicare Part B Claims Measure Specifications / eCQM Specifications/ MIPS CQM Specifications/ Medicare CQM Specifications (collection type available only in the APP and/or APP Plus)
Current Measure Description:	Percentage of patients 18-85 years of age who had a diagnosis of essential hypertension starting before and continuing into, or starting during the first six months of the measurement period, and whose most recent blood pressure was adequately controlled (<140/90mmHg) during the measurement period.
Substantive Change:	Updated denominator exclusion: For all collection types: Removed: specific encounter requirements from the frailty/advanced illness exclusion.
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale	We proposed to update the denominator exclusion by removing the requirement for patients to have had at least one inpatient or two outpatient encounters to recognize a diagnosis of advanced illness. The removal of this requirement within the denominator exclusion reduces the burden of identifying applicable encounters, while still identifying patients with an indication of frailty. This is particularly applicable for those patients seen outside of their reporting clinician's medical record. This revision will update the denominator exclusion to remove any patient 66 years of age and older who has a diagnosis of advanced illness during the measurement period or the year prior from the denominator of measure Q236. Decreasing complexity and burden of this element ensures consistent implementation allowing for more comparable data.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q236: Controlling High Blood Pressure. Two commenters supported the proposed update to the frailty exclusion criteria. One of these commenters requested clarification regarding how the clinician will know when their patient saw a different clinician at a different medical practice and obtained a frailty and/or advanced illness diagnosis, which then removes them from the clinician's denominator.

Response: We thank the commenter for supporting the substantive changes to this measure. As noted above, removal of the additional requirement for patients to have had either one inpatient or two outpatient encounters to recognize a diagnosis of advanced illness reduces the burden of identifying applicable encounters, while still identifying patients with an indication of frailty. We encourage clinicians to provide care as they determine best supports all patients during their healthcare journey. When submitting this measure, the clinician would report on patients based upon the information within the medical record in accordance with the current measure specification. The update to the denominator exclusion does not change how the measure data may be captured and reported only the criteria to determine whether a patient is appropriate for the quality action assessment.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62529), we are finalizing the changes to measure Q236 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.18. Use of High-Risk Medications in Older Adults

Category	Description
CBE # / eCQM CBE #:	0022 / N/A
Quality #:	238
CMS eCQM ID:	CMS156v13
Current Collection Type:	eCQM Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of patients 65 years of age and older who were ordered at least two high-risk medications from the same drug class.
Substantive Change:	<p>Updated numerator definition: For the MIPS CQM Specifications collection type: Numerator (Submission Criteria 1): Table 1 - High-Risk Medications at any Dose or Duration Removed: From Anticholinergics, first-generation antihistamines: Carbinoxamine, Clemastine, Dexbrompheniramine, Dexchlorpheniramine, Pyrilamine From Antispasmodics: Belladonna alkaloids, Methscopolamine, Propantheline From Cardiovascular, alpha agonists, central: Methyldopa From Cardiovascular, other: Disopyramide From Central nervous system, antidepressants: Protriptyline Trimipramine From Central nervous system, barbiturates: Amobarbital, Butobarbital, Pentobarbital, Secobarbital From Central nervous system, vasodilators: Isoxsuprine From Endocrine system, sulfonylureas, long-duration: Chlorpropamide From Endocrine system, other: Megestrol From Pain medications, other: Meperidine</p> <p>Added: A row with one medication is considered a group (or drug class) of one; therefore, two orders of that same medication are numerator compliant.</p> <p>Added: To Central nervous system, barbiturates: Primidone Endocrine system, megestrol: Megestrol Pain medications, meperidine: Meperidine To Pain medications, other: Ketorolac, includes parenteral and oral</p> <p>Table 3 – High-Risk Medications With Average Daily Dose Criteria Removed: Alpha agonists, central: Reserpine >0.1 mg per day</p> <p>Numerator (Submission Criteria 2): Table 4 – High-Risk Medications Removed: From Benzodiazepines, long, short and intermediate acting: Flurazepam, Quazepam</p> <p>Added: To Benzodiazepines, long, short and intermediate acting: Clobazam</p>
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale	<p>We proposed to update the list of high-risk medications to align with 2023 AGS Beers Criteria¹¹⁰¹ and ensure that older adults are not prescribed inappropriate medications. This change will also align with PY 2025 eCQM version (CMS156v13), which supports alignment between the collection types. We also proposed to add clarification that the medications found within a single row of table one, within the specification, represent a unique group or drug class. Therefore, two orders from that group or drug class will be consider numerator compliant for this measure, which has an inverse analytic for the calculation of performance.</p>

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62530), we are finalizing the changes to measure Q238 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹⁰¹ The 2023 American Geriatrics Society Beers Criteria Update Expert Panel. (2023). American Geriatrics Society 2023 updated AGS Beers Criteria for potentially inappropriate medication use in older adults. Journal of the American Geriatrics Society, 71(7), 2052-2081. <https://doi.org/10.1111/jgs.18372>.

D.19. Barrett's Esophagus

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	249
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Measure Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of esophageal biopsy reports that document the presence of Barrett's mucosa that also include a statement about dysplasia.
Substantive Change:	Updated denominator exception: For all collection types: Added: Specimen site other than anatomic location of esophagus. Updated denominator exclusion: For all collection types: Removed: Specimen site other than anatomic location of esophagus.
Measure Steward:	College of American Pathologists
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to remove the denominator exclusion so that all patients with a diagnosis for Barrett's Esophagus are included in the denominator of the measure and proposed to add a denominator exception for specimen sites other than the anatomic location of the esophagus. Revising the measure to include this element as a denominator exception will allow for an automated capture of the relevant cases with less manual intervention reducing overall burden of measure reporting.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62531), we are finalizing the changes to measure Q249 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.20. Sleep Apnea: Severity Assessment at Initial Diagnosis

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	277
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of obstructive sleep apnea who had an apnea hypopnea index (AHI), a respiratory disturbance index (RDI), or a respiratory event index (REI) documented or measured within 2 months of initial evaluation for suspected obstructive sleep apnea.
Substantive Change:	Updated denominator exception: Added: patients previously diagnosed with OSA and severity assessed by another provider.
Measure Steward:	American Academy of Sleep Medicine
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the denominator exception by adding that patients previously diagnosed with obstructive sleep apnea (OSA), with severity assessed by another clinician and documented will not need to have the testing completed again. This denominator exceptions allows clinician judgement as to whether repeat testing is needed, as we do not want to promote overutilization. This revision increases clarity of this element and ensures consistent implementation allowing for more comparable data.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to add the denominator exclusion for patients previously diagnosed with OSA and severity assessed by another provider to measure Q277: Sleep Apnea: Severity Assessment at Initial Diagnosis. The commenter agreed this change will remove unnecessary repeat assessments for clinicians reporting this measure.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62531), we are finalizing the changes to measure Q277 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.21. Dementia: Cognitive Assessment

Category	Description
CBE # / eCQM CBE #:	N/A / 2872e
Quality #:	281
CMS eCQM ID:	CMS149v13
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of patients, regardless of age, with a diagnosis of dementia for whom an assessment of cognition is performed and the results reviewed at least once within a 12-month period.
Substantive Change:	Updated guidance: Added: The measure requires a diagnosis of dementia is present before the routine assessment of cognition once in a 12-month period.
Measure Steward:	American Academy of Neurology
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the measure guidance to clarify that the diagnosis of dementia must be present prior to the cognitive assessment. This will ensure that any cognitive assessments performed prior to the dementia diagnosis but occurred during the 12-month lookback period will not be attributed to this measure numerator. ¹¹⁰² This change will ensure consistency in the abstraction of the measure’s numerator elements based upon a specific timeframe that support rigorous data for the calculation of MIPS performance rates.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Two commenters supported the proposed substantive changes to measure Q281: Dementia: Cognitive Assessment.

Response: We thank the commenters for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62532), we are finalizing the changes to measure Q281 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.22. Dementia: Functional Status Assessment

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	282
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients with dementia for whom an assessment of functional status was performed at least once in the last 12 months.
Substantive Change:	Updated denominator criteria: Added: coding for speech language pathology and nuclear medicine.
Measure Steward:	American Academy of Neurology/American Psychiatric Association
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to add encounter codes for speech language pathologists and nuclear medicine to the denominator criteria as these are appropriate specialties to identify changes in functional status in patients diagnosed with dementia. Dementia, which can be caused by “different brain diseases,” affects a person’s activities of daily living including, but not limited to eating and swallowing, and speech. ¹¹⁰³

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q282: Dementia: Functional Status Assessment.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62533), we are finalizing the changes to measure Q282 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹⁰³ American Speech-Language-Hearing Association (ASHA). Dementia. <https://www.asha.org/public/speech/disorders/dementia/>.

D.23. Dementia: Safety Concern Screening and Follow-Up for Patients with Dementia

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	286
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients with dementia or their caregiver(s) for whom there was a documented safety concerns screening in two domains of risk: 1) dangerousness to self or others and 2) environmental risks; and if safety concerns screening was positive in the last 12 months, there was documentation of mitigation recommendations, including but not limited to referral to other resources.
Substantive Change:	Updated denominator criteria: Added: coding for speech language pathology and nuclear medicine.
Measure Steward:	American Academy of Neurology/American Psychiatric Association
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update the denominator criteria to include coding for speech language pathology and nuclear medicine as this measure is applicable to their scope of care. Dementia, which can be caused by "different brain diseases," affects a person's activities of daily living including, but not limited to eating and swallowing, and speech. ¹¹⁰⁴

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Two commenters supported the proposed substantive changes to measure Q286: Dementia: Safety Concern Screening and Follow-Up for Patients with Dementia.

Response: We thank the commenters for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62534), we are finalizing the changes to measure Q286 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹⁰⁴ See footnote ASHA in Table D.22 of this Appendix.

D.24. Dementia: Education and Support of Caregivers for Patients with Dementia

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	288
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients with dementia whose caregiver(s) were provided with education on dementia disease management and health behavior changes AND were referred to additional resources for support in the last 12 months.
Substantive Change:	Updated denominator criteria: Added: coding for speech language pathology and nuclear medicine.
Measure Steward:	American Academy of Neurology/American Psychiatric Association
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update the denominator criteria to include coding for speech language pathology and nuclear medicine as this measure is applicable to their scope of care. Dementia, which can be caused by “different brain diseases,” affects a person’s activities of daily living including, but not limited to eating and swallowing, and speech. ¹¹⁰⁵

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Two commenters supported the proposed substantive changes to measure Q288: Dementia: Education and Support of Caregivers for Patients with Dementia.

Response: We thank the commenters for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62535), we are finalizing the changes to measure Q288 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹⁰⁵ See footnote ASHA in Table D.22 of this Appendix.

D.25. Assessment of Mood Disorders and Psychosis for Patients with Parkinson’s Disease

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	290
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of all patients with a diagnosis of Parkinson’s Disease [PD] who were assessed for depression, anxiety, apathy, AND psychosis once during the measurement period.
Substantive Change:	Updated denominator criteria: Added: coding for neuropsychology and behavioral health.
Measure Steward:	American Academy of Neurology
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the denominator criteria to include coding for neuropsychology and behavioral health as it’s clinically appropriate for these clinician types to assess for depression, anxiety, apathy, and psychosis.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed substantives change to add coding for neuropsychology to measure Q290: Assessment of Mood Disorders and Psychosis for Patients with Parkinson’s Disease.

Response: We thank the commenters for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62536), we are finalizing the changes to measure Q290 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.26. Assessment of Cognitive Impairment or Dysfunction for Patients with Parkinson’s Disease

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	291
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of all patients with a diagnosis of Parkinson’s Disease [PD] who were assessed for cognitive impairment or dysfunction once during the measurement period.
Substantive Change:	Updated denominator criteria: Added: coding for neuropsychology, behavioral health, and physical and occupational therapy.
Measure Steward:	American Academy of Neurology
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the denominator criteria to include coding for neuropsychology, behavioral health, and physical and occupational therapy as it’s clinically appropriate for these clinician types to assess for cognitive impairment or dysfunction.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed substantives change to add coding for neuropsychology to measure Q291: Assessment of Cognitive Impairment or Dysfunction for Patients with Parkinson’s Disease. Several additional commenters appreciated the addition of coding for physical therapy for measure Q291.

Response: We thank the commenters for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62536), we are finalizing the changes to measure Q291 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.27. Rehabilitative Therapy Referral for Patients with Parkinson's Disease

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	293
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of all patients with a diagnosis of Parkinson's Disease who were referred to physical, occupational, speech, or recreational therapy once during the measurement period.
Substantive Change:	Updated denominator criteria: Added: coding for neuropsychology, behavioral health, and speech language pathology.
Measure Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update the denominator criteria to include coding for neuropsychology, behavioral health, and speech language pathology as this measure is applicable to their scope of care.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q293: Rehabilitative Therapy Referral for Patients with Parkinson's Disease.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62536), we are finalizing the changes to measure Q293 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.28. Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	317
CMS eCQM ID:	CMS22v13
Current Collection Type:	Medicare Part B Claims Measure Specifications / eCQM Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of patient visits for patients aged 18 years and older seen during the measurement period who were screened for high blood pressure AND a recommended follow-up plan is documented, as indicated, if blood pressure is elevated or hypertensive.
Substantive Change:	Updated denominator criteria: For the MIPS CQM Specifications and the Medicare Part B Claims Measure Specifications collection types: Added: coding for nutrition/dietitian clinician type. Updated numerator definition: For all collection types: Revised: intervals for rescreening for first and second hypertensive BP readings.
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to add encounter codes for nutrition therapy to the denominator criteria for the MIPS CQM Specifications and the Medicare Part B Claims Measure collection types as this is an appropriate setting to identify people who may have elevated blood pressure (BP) readings. Nutritional approaches play a pivotal role in helping to reduce the risk of hypertension or control blood pressure in people with hypertension. ¹¹⁰⁶ We proposed to remove the minimum timeframe for follow-up screenings for patients with elevated BP readings for all collection types. This change will allow clinician discretion to recommend a follow-up plan based on the patient's current health status. Additionally, this supports stability of this measure component, as the frequency is each visit, within the specification over time, while still maintaining consistency with the current guidelines. ¹¹⁰⁷

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive change to eliminate the minimum timeframe for follow-up screenings for patients with elevated blood pressure readings for all collection types to measure Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented. The commenter agreed this change will enable clinicians to exercise their judgment in recommending follow-up plans based on each patient's health status, thereby personalizing care to better meet individual needs and ultimately enhancing the quality of care delivered.

A second commenter thanked CMS for adding medical nutrition therapy codes to the denominator criteria as this acknowledges the important role of RDNs in managing elevated blood pressure. The commenter also supported eliminating the minimum timeframe for follow-up screenings as it gives clinicians the flexibility to tailor care to the specific needs of each patient.

Response: We thank the commenters for supporting the substantive change to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62537), we are finalizing the changes to measure Q317 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

J., Muntner, P., Ovbiagele, B., Smith, S. C., Jr, Spencer, C. C., Stafford, R. S., Taler, S. J., Thomas, R. J., Williams, K. A., Sr, Williamson, J. D., ... Wright, J. T., Jr (2018). 2017 ACC/AHA/AAPA/ABC/ACPM/AGS/APhA/ASH/ASPC/NMA/PCNA Guideline for the Prevention, Detection, Evaluation, and Management of High Blood Pressure in Adults: A Report of the American College of Cardiology/American Heart Association Task Force on Clinical Practice Guidelines. *Journal of the American College of Cardiology*, 71(19), e127–e248. <https://doi.org/10.1016/j.jacc.2017.11.006>.

D.29. Appropriate Follow-Up Interval for Normal Colonoscopy in Average Risk Patients

Category	Description
CBE # / eCQM CBE #:	0658 / N/A
Quality #:	320
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Measure Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 45 to 75 years of age receiving a screening colonoscopy without biopsy or polypectomy who had a recommended follow-up interval of at least 10 years for repeat colonoscopy documented in their colonoscopy report.
Substantive Change:	<p>The measure description is revised to read: For all collection types: Percentage of patients aged 45 to 75 years of age receiving a screening colonoscopy without biopsy or polypectomy who had a recommended follow-up interval of 10 years for repeat colonoscopy documented in their colonoscopy report.</p> <p>Updated numerator: For all collection types: Revised: Patients who had recommended follow-up interval of 10 years for repeat colonoscopy documented in their colonoscopy report.</p> <p>Updated numerator note: For all collection types: Added: To meet the numerator, patients with a negative screening colonoscopy should have documentation that they received counseling or instruction to have a follow-up or repeat colonoscopy in 10 years. A 6 month period before or after 10 years is considered within the recommended follow-up interval.</p> <p>Updated numerator options: For all collection types: Revised:</p> <p>Performance Met: Recommended follow-up interval for repeat colonoscopy of 10 years documented in colonoscopy report and communicated with patient.</p> <p>Denominator Exception: Documentation of medical reason(s) for not recommending a 10 year follow-up interval (e.g., inadequate prep, familial or personal history of colonic polyps, patient had no adenoma and age is \geq 66 years old, or life expectancy < 10 years, other medical reasons)</p> <p>Performance Not Met: A 10 year follow-up interval for colonoscopy not recommended, reason not otherwise specified.</p>
Measure Steward:	American Gastroenterological Association
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update the measure description, numerator, and numerator options to ensure the time frame for recommended follow up after a normal colonoscopy for the average risk patient accurately reflects current guidelines which states “[n]ew observational and modeling studies of colonoscopy confirm and strengthen the evidence base to support the conclusion that individuals with normal colonoscopy are at lower-than-average risk for CRC. Based on this reduced risk, we recommend CRC screening in average-risk individuals be repeated 10 years after a normal examination complete to the cecum with bowel preparation adequate to detect polyps >5 mm in size.” ¹¹⁰⁸ Additionally, we proposed to add a numerator note to indicate inclusion of documentation that the patient has received counseling and instruction on when a repeat colonoscopy should be scheduled. This change will ensure the patient is aware of clinical recommendations to drive healthy outcomes.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62538), we are finalizing the changes to measure Q320 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹⁰⁸ Gupta, S., Lieberman, D., Anderson, J. C., Burke, C. A., Dominitz, J. A., Kaltenbach, T., Robertson, D. J., Shaikat, A., Syngal, S., & Rex, D. K. (2020). Recommendations for Follow-Up After Colonoscopy and Polypectomy: A Consensus Update by the US Multi-Society Task Force on Colorectal Cancer. *Gastrointestinal Endoscopy*, 91(3), 463–485.e5. <https://doi.org/10.1016/j.gie.2020.01.014>.

D.30. Cardiac Stress Imaging Not Meeting Appropriate Use Criteria: Preoperative Evaluation in Low-Risk Surgery Patients

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	322
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of stress single-photon emission computed tomography (SPECT) myocardial perfusion imaging (MPI), stress echocardiogram (ECHO), cardiac computed tomography angiography (CCTA), or cardiac magnetic resonance (CMR) performed in low-risk surgery patients 18 years or older for preoperative evaluation during the 12-month submission period.
Substantive Change:	<p>The measure description is revised to read: Percentage of stress single-photon emission computed tomography (SPECT) myocardial perfusion imaging (MPI), stress echocardiogram (ECHO), multigated acquisition scan (MUGA), cardiac computed tomography angiography (CCTA), or cardiac magnetic resonance (CMR) performed in low-risk surgery patients 18 years or older for preoperative evaluation during the 12-month submission period.</p> <p>Updated instructions: Added: multigated acquisition scan (MUGA).</p> <p>Updated denominator: Added: multigated acquisition scan (MUGA).</p> <p>Updated denominator criteria: Added: coding for multigated acquisition scan (MUGA).</p> <p>Updated numerator: Added: multigated acquisition scan (MUGA).</p>
Measure Steward:	American College of Cardiology Foundation
High Priority Measure:	Yes
Measure Type:	Efficiency
Rationale	We proposed to update multiple components of the measure to add MUGA. Even though MUGA scanning allows a clinician to evaluate many heart parameters and can be done while resting or under stress, this diagnostic imaging test will ensure this type of imaging is not performed on low-risk surgery patients since the risks of the procedure exceed the expected clinical benefit for the denominator eligible patient population. ¹¹⁰⁹ The MUGA scan is primarily used for assessing myocardial function in patients on cardiotoxic chemotherapy. ¹¹¹⁰

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62539), we are finalizing the changes to measure Q322 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹⁰⁹ Winchester, D. E., Maron, D. J., Blankstein, R., Chang, I. C., Kirtane, A. J., Kwong, R. Y., Pellikka, P. A., Prutkin, J. M., Russell, R., & Sandhu, A. T. (2023). ACC/AHA/ASE/ASNC/ASPC/HFSA/HRS/SCAI/SCCT/SCMR/STS 2023 Multimodality Appropriate Use Criteria for the Detection and Risk Assessment of Chronic Coronary Disease. *Journal of Cardiovascular Magnetic Resonance: Official Journal of the Society for Cardiovascular Magnetic Resonance*, 25(1), 58. <https://doi.org/10.1186/s12968-023-00958-5>.

¹¹¹⁰ Odak, M., & Kayani, W. T. (2023). MUGA Scan. In *StatPearls*. StatPearls Publishing. <https://www.ncbi.nlm.nih.gov/books/NBK564365/>.

D.31. Adult Sinusitis: Antibiotic Prescribed for Acute Viral Sinusitis (Overuse)

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	331
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients, aged 18 years and older, with a diagnosis of acute viral sinusitis who were prescribed an antibiotic within 10 days after onset of symptoms.
Substantive Change:	Updated the instructions: Revised: This measure is to be submitted once for each occurrence of acute viral sinusitis (AVS) during the performance period. Each unique occurrence starts with the onset of AVS symptoms and concludes with the resolution of AVS symptoms or after 90 days if a resolution of AVS symptoms is not documented. If multiple encounters are documented within an occurrence, Merit-based Incentive Payment System (MIPS) eligible clinicians should submit the most recent encounter during that occurrence. A new occurrence of AVS cannot start until the previous occurrence during the performance period has concluded.
Measure Steward:	American Academy of Otolaryngology – Head and Neck Surgery Foundation
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update the measure instructions to clarify what constitutes an occurrence for the purposes of this measure. This additional guidance will further clarify how patients are attributed to the denominator of this measure for each eligible occurrence. This change will ensure consistency in the abstraction of the measure's elements that support rigorous data for the calculation of MIPS performance rates.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62540), we are finalizing the changes to measure Q331 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.32. Maternity Care: Postpartum Follow-up and Care Coordination

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	336
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients, regardless of age, who gave birth during a 12-month period who were seen for postpartum care before or at 12 weeks of giving birth and received the following at a postpartum visit: breast-feeding evaluation and education, postpartum depression screening, postpartum glucose screening for gestational diabetes patients, family and contraceptive planning counseling, tobacco use screening and cessation education, healthy lifestyle behavioral advice, and an immunization review and update.
Substantive Change:	<p>The measure description is revised to read: Percentage of patients, regardless of age, who gave birth during a 12-month period who were seen for postpartum care before or at 12 weeks of giving birth and received the following at a postpartum visit: breastfeeding evaluation and education, postpartum depression screening, intimate partner violence screening, postpartum glucose screening for gestational diabetes patients, family and contraceptive planning counseling, tobacco use screening and cessation education, healthy lifestyle behavioral advice, and an immunization review and update.</p> <p>Updated numerator: Added: intimate partner violence screening.</p> <p>Updated numerator definition: Added: Intimate Partner Violence Screening – Patients who were screened for intimate partner violence before or at 12 weeks postpartum. Questions may be asked either directly by a health care provider or in the form of self-completed paper-or computer-administered questionnaires, and results should be documented in the medical record. Intimate partner violence screening should include a self-reported validated intimate partner violence screening tool (e.g., Abuse Assessment Screen (AAS), Extended – Hurt, Insult, Threaten, Scream (E-HITS), Humiliation, Afraid, Rape, Kick (HARK)).</p> <p>Updated numerator instructions: Added: intimate partner violence screening.</p>
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update multiple measure components to include intimate partner violence screening. “The effects of intimate partner violence (IPV) on maternal and neonatal outcomes are multifaceted and largely preventable.” ¹¹¹¹ This type of abuse has maternal and neonatal consequences on mental and physical health that could be far reaching beyond the perinatal period; ¹¹¹² therefore, intimate partner violence screening was proposed for inclusion. This revision will support clinicians currently screening and will encourage others to begin screening for this risk within this patient population as IPV may escalate during the postpartum period. ¹¹¹³ The American College of Obstetricians and Gynecologists recommend including screening for IPV at the postpartum checkup to help identify patients experiencing IPV so that support may be offered to break this cycle, leading to positive outcomes for both maternal and neonatal health. ¹¹¹⁴

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62541), we are finalizing the changes to measure Q336 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.33. HIV Medical Visit Frequency

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	340
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients, regardless of age with a diagnosis of HIV who had at least one medical visit in each 6 month period of the 24 month measurement period, with a minimum of 60 days between medical visits.
Substantive Change:	<p>Modified collection type: eCQM Specifications, MIPS CQM Specifications collection type.</p> <p>The measure title is revised from “HIV Medical Visit Frequency” to: HIV Annual Retention in Care.</p> <p>The measure description is revised to read: Percentage of patients, regardless of age, with a diagnosis of Human Immunodeficiency Virus (HIV) before or during the first 240 days of the performance period who had at least two eligible encounters or at least one eligible encounter and one HIV viral load test that were at least 90 days apart within the measurement period.</p> <p>The measure denominator is revised to read: Patients, regardless of age, with a diagnosis of HIV before or during the first 240 days of the performance period who had at least one eligible encounter during the first 240 days of the performance period.</p> <p>The measure denominator note is revised to read: Only patients with an eligible encounter in the first 240 days are included in this measure to allow for sufficient time to complete a second eligible encounter or viral load laboratory at least 90 days after the initial encounter during the performance period.</p> <p>Updated denominator criteria: Added: coding for telephone and home visit patient encounters.</p> <p>Updated denominator exclusion: Removed: Patient died at any time during the 24-month measurement period.</p> <p>The measure numerator is revised to read: Number of patients who had at least one eligible encounter and one HIV viral load test at least 90 days apart during the performance period, or who had at least two eligible encounters at least 90 days apart during the performance period.</p> <p>Updated numerator note: Added: A patient would be included in the measure numerator if they have either 1) two eligible encounters at least 90 days apart, or 2) one eligible encounter and one viral load test at least 90 days apart from each other. The encounter or encounters that cause a patient to be included in the numerator do not need to include the encounter that caused the patient to be included in the denominator.</p> <p>The measure numerator options are revised to read:</p> <p>Performance Met: Patient had two eligible encounters at least 90 days apart or one eligible encounter and one HIV viral load test at least 90 days apart</p> <p>Performance Not Met: Patient did not have two eligible encounters at least 90 days apart or one eligible encounter and one HIV viral load test at least 90 days apart</p>
Measure Steward:	Health Resources and Services Administration
High Priority Measure:	Yes
Measure Type:	Process
Rationale	<p>We proposed to update the collection types available for this measure to include the eCQM collection type to provide choice in submission method. We also proposed to revise multiple components of the measure allowing for improved quality outcome which is to engage persons who are infected with HIV in regular HIV care that promote test-and-treat strategies.¹¹¹⁵</p> <p>In the event the proposed substantive change(s) are finalized, the substantive changes will not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes. As such, if the performance data submitted meets the criteria for creation of a performance period benchmark, a new benchmark will be used for scoring.</p>

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62542), we are finalizing the changes to measure Q340 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

The Spectrum of Engagement in HIV Care and its Relevance to Test-and-treat Strategies for Prevention of HIV Infection. *Clinical Infectious Diseases: An Official Publication of the Infectious Diseases Society of America*, 52(6), 793–800. <https://doi.org/10.1093/cid/ciq243>.

D.34. Rate of Carotid Artery Stenting (CAS) for Asymptomatic Patients, Without Major Complications (Discharged to Home by Post-Operative Day #2)

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	344
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percent of asymptomatic patients undergoing CAS who are discharged to home no later than post-operative day #2.
Substantive Change:	<p>The measure title is revised from Rate of Carotid Artery Stenting (CAS) for Asymptomatic Patients, Without Major Complications (Discharged to Home by Post-Operative Day #2) to: Rate of Carotid Endarterectomy (CEA) or Carotid Artery Stenting (CAS) for Asymptomatic Patients, Without Major Complications (Discharged to Home by Post-Operative Day #2)</p> <p>The measure description is revised to read: Percent of asymptomatic patients undergoing Carotid Endarterectomy (CEA) or Carotid Artery Stenting (CAS) without major complication who are discharged to home no later than post-operative day #2.</p> <p>Updated instructions: Added: CEA.</p> <p>Updated denominator: Added: CEA.</p> <p>Updated denominator criteria: Added: coding for carotid endarterectomy.</p> <p>Updated numerator: Added: CEA.</p> <p>Updated numerator definition: Added: procedure for CEA or CAS.</p> <p>Updated numerator options: Added: CEA.</p>
Measure Steward:	Society for Vascular Surgery
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale	<p>We proposed to revise this measure to include Carotid Endarterectomy (CEA) to assess for post-operative complications for asymptomatic patients who had CEA. CEA for asymptomatic carotid stenosis reduces the risk of ipsilateral stroke, and any stroke, by approximately 30 percent over 3 years.¹¹¹⁶ Previously, assessment of outcomes for CEA procedures was a separate measure. As both procedures are appropriate for treating asymptomatic carotid artery stenosis, these measures are being combined so that a full picture of positive outcomes can be captured for this patient population.¹¹¹⁷ Additionally, by combining these measures the denominator eligible patient population may increase allowing for more robust data for participating MIPS clinicians.</p> <p>In the event the proposed substantive change(s) are finalized, the substantive changes will not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes. As such, if the performance data submitted meets the criteria for creation of a performance period benchmark, a new benchmark will be used for scoring.</p>

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62542 through 62543), we are finalizing the changes to measure Q344 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.35. Unplanned Reoperation within the 30-Day Postoperative Period

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	355
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 18 years and older who had any unplanned reoperation within the 30 day postoperative period.
Substantive Change:	Updated denominator criteria: Revised: coding for fissurectomy, including sphincterotomy.
Measure Steward:	American College of Surgeons
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale	We proposed to update denominator criteria to revise coding for fissurectomy, including sphincterotomy as this is an operative procedure that could have complications requiring unplanned reoperation within 30 days postoperatively.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62544), we are finalizing the changes to measure Q355 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.36. Optimizing Patient Exposure to Ionizing Radiation: Count of Potential High Dose Radiation Imaging Studies: Computed Tomography (CT) and Cardiac Nuclear Medicine Studies

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	360
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of computed tomography (CT) and cardiac nuclear medicine (myocardial perfusion studies) imaging reports for all patients, regardless of age, that document a count of known previous CT (any type of CT) and cardiac nuclear medicine (myocardial perfusion) studies that the patient has received in the 12-month period prior to the current study.
Substantive Change:	<p>The measure description is revised to read: Percentage of computed tomography (CT) and cardiac nuclear medicine (myocardial perfusion or infarct avid imaging) reports for all patients, regardless of age, that document a count of known previous CT (any type of CT) and cardiac nuclear medicine (myocardial perfusion or infarct avid imaging) studies that the patient has received in the 12-month period prior to the current study.</p> <p>The measure denominator is revised to read: All final reports for patients, regardless of age, undergoing a CT or cardiac nuclear medicine (myocardial perfusion or infarct avid imaging) procedure.</p> <p>Updated denominator criteria: Added: coding for cardiology infarct imaging.</p> <p>The measure numerator is revised to read: CT and cardiac nuclear medicine (myocardial perfusion or infarct avid imaging) reports that document a count of known previous CT (any type of CT) and cardiac nuclear medicine (myocardial perfusion or infarct avid imaging) studies that the patient has received in the 12-month period prior to the current study.</p> <p>Updated numerator instructions: Added: infarct avid imaging.</p> <p>The measure numerator options are revised to read:</p> <p>Performance Met: Count of previous CT (any type of CT) and cardiac nuclear medicine (myocardial perfusion or infarct avid imaging) studies documented in the 12-month period prior to the current study.</p> <p>Performance Not Met: Count of previous CT and cardiac nuclear medicine (myocardial perfusion or infarct avid imaging) studies not documented in the 12-month period prior to the current study, reason not given.</p>
Measure Steward:	American College of Radiology
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to revise multiple components of this measure to include infarct avid imaging in the cardiac nuclear medicine imaging study that involves the use of radiation, including a radiotracer or contrast agent and/or Imaging modalities, such as positron emission tomography (PET), single-photon emission computed tomography (SPECT), or magnetic resonance imaging (MRI). ¹¹¹⁸ Given that this imaging can expose a patient to potentially high doses of radiation, ¹¹¹⁹ including it in the denominator of this measure requires the clinician to document a more complete count of previous cardiac nuclear medicine imaging studies, increasing patient safety by preventing continued exposure to radiation.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter opposed the proposed substantive changes to measure Q360: Optimizing Patient Exposure to Ionizing Radiation: Count of Potential High Dose Radiation Imaging Studies: Computed Tomography (CT) and Cardiac Nuclear Medicine Studies to expand the denominator of eligible cases by including coding for cardiology infarct imaging. The commenter stated this change will create a meaningful burden on radiologists to report all prior CT and cardiac nuclear medicine studies that a patient has received in the 12-month period prior to the current study.

Response: We acknowledge the commenter's concerns and agree that the addition of infarct avid imaging may increase the denominator. However, this measure already requires a count of cardiac nuclear medicine studies of which infarct avid imaging is a component. The inclusion of infarct avid imaging as one of the options of nuclear cardiac medicine allows for a more complete

¹¹¹⁸ Enabnit, A. & Warren, A. (2023). Infarct Avid Imaging Study: Purpose, Procedure, and Applications. <https://www.dovemed.com/health-topics/focused-health-topics/infarct-avid-imaging-study-purpose-procedure-and-applications>.

¹¹¹⁹ Salah, H., Alkhorayef, M., Jambi, L., Almuwannis, M., & Sulieman, A. (2023). Radiation Dose to Patients and Public Exposure in Cardiac Rest and Stress Single Photon Emission Computed Tomography Examinations. *Radiation Physics and Chemistry*. <https://doi.org/10.1016/j.radphyschem.2023.111383>.

count of previous cardiac nuclear medicine imaging studies, increasing patient safety by preventing continued exposure to radiation.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62545), we are finalizing the changes to measure Q360 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.37. Closing the Referral Loop: Receipt of Specialist Report

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	374
CMS eCQM ID:	CMS50v13
Current Collection Type:	eCQM Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of patients with referrals, regardless of age, for which the referring clinician receives a report from the clinician to whom the patient was referred.
Substantive Change:	<p>Updated denominator criteria: For all collection types: Added: coding for psychology and neuropsychology.</p> <p>The measure numerator definition is revised to read: For the MIPS CQM Specifications collection type: Revised: A written document prepared by the eligible clinician (and staff) to whom the patient was referred and that accounts for their findings, provides summary of care information about findings, diagnostics, assessments and/or plans of care, or states the patient did not attend the appointment, and is provided to the referring eligible clinician.</p>
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale	<p>We proposed to add psychology and neuropsychology encounter codes to the denominator criteria as this measure is applicable to their scope of care. This expansion of the denominator will allow more clinician types to submit the measure leading to an increase in denominator eligibility, capturing a more complete patient population, as it is clinically appropriate for these clinician types to complete the quality action for a patient referred to a specialist.</p> <p>We proposed to revise the numerator definitions for the MIPS CQM collection type to clarify which information should be included in the referring clinician's report to successfully close the referral loop. This revision increases clarity of this element and ensures consistent implementation allowing for more comparable data.</p>

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q374: Closing the Referral Loop: Receipt of Specialist Report to require documentation of patient no-shows or missed appointments in the reports sent to referring clinicians.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62546), we are finalizing the changes to measure Q374 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.38. Functional Status Assessment for Total Hip Replacement

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	376
CMS eCQM ID:	CMS56v13
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of patients 19 years of age and older who received an elective primary total hip arthroplasty (THA) and completed a functional status assessment within 90 days prior to the surgery and in the 300 – 425 days after the surgery.
Substantive Change:	Updated initial patient population: Revised: encounter timeframe from November of the year prior to August of the year prior.
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to revise initial patient population by changing the timing of the encounter to better align with the post-surgical assessment timeframe of 300 to 425 days after the original THA surgery. This will also harmonize the timeframe of the patient encounter with the administrative claims measure “Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA)” available for Hospital Inpatient Quality Reporting (88 FR 59067 through 59070), thereby aligning timing specificity and patterns across similar measures. Measure alignment, in accordance with clinical recommendations, guidelines, and best practices, allows for consistent and comparable data points, which leads to actionable data to drive quality care, through understanding where the gaps in care are within a patient population or along the continuum of care.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes on the timing of the encounter to better align with the post-surgical assessment timeframe of 300 to 425 days after the original THA surgery for measure Q376: Functional Status Assessment for Total Hip Replacement. This revision aligns the timeframe for measure Q376 with that of other quality reporting programs (for example, the Hospital-Level THA/TKA Patient Reported Outcome-Based Performance Measure).

Response: We thank the commenter for supporting the substantive changes to this measure.

Comment: One commenter noted the proposed substantive changes to this measure and recommended revising the age criterion to include patients 18 years and older. This adjustment would align the measure with existing orthopedic standards and simplify the tracking process by maintaining a straightforward adult population of 18 years and older, thereby reducing complexity for clinicians and ensuring more accurate data collection across the board.

Response: We thank the commenter for their feedback. While we endeavor to align measures across reporting programs, there may be nuances within the program and/or collection type requirements that lead to small differences between specifications. The age criterion starts at 19 because this is determined at the start of the measurement period, while the denominator eligible procedure has a lookback period starting in November two years prior to the measurement period, allowing for patients age 18 at the time of the procedure to be included within the denominator eligible patient population. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62546), we are finalizing the changes to measure Q376 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.39. Adherence to Antipsychotic Medications For Individuals with Schizophrenia

Category	Description
CBE # / eCQM CBE #:	1879 / N/A
Quality #:	383
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of individuals at least 18 years of age as of the beginning of the performance period with schizophrenia or schizoaffective disorder who had at least two prescriptions filled for any antipsychotic medication and who had a Proportion of Days Covered (PDC) of at least 0.8 for antipsychotic medications during the performance period.
Substantive Change:	Updated denominator note: Removed: distinction of typical versus atypical, 'days' supply' notation, and medication HCPCS codes. Updated denominator criteria: Removed: HCPCS coding from prescription criteria.
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale	We proposed to remove "days' supply" and HCPCS (J codes) from the list of antipsychotic medications in the measure. This revision will ensure inclusion for any duration of the listed long acting injectables permitting the clinician, or site, to obtain days' supply information from any appropriate clinical or administrative source, thus aligning the calculation of PDC with all appropriate medications listed in the measure. This revision reduces the burden of collecting this aspect of the measure from medical records. Decreasing complexity and burden of this element ensures consistent implementation allowing for more comparable data. Finally, we proposed to remove "typical" and "atypical" as part of the subheadings of the lists of antipsychotic medications as this distinction does not apply to the list of oral and long-acting injectable antipsychotic medications listed under each of the categories which include both typical and atypical medications. ¹¹²⁰

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter expressed that it had previously communicated its concern that the current version of measure Q383: Adherence to Antipsychotic Medications For Individuals with Schizophrenia is not inclusive of long-acting injectable medications (LAI) with days' supply beyond 28 days, and therefore unfairly penalizes clinicians who use these treatments. While the commenter appreciated that CMS' proposal is intended to address this concern by removing 'days' supply' and HCPCS (J codes) from the list of antipsychotic medications to include any duration of long acting injectables, the commenter was concerned that this approach would create burden and confusion among providers, and variability in the measure's implementation across quality programs.

The commenter stated that the proposed substantive changes to measure Q383 do not provide sufficient clarity about the medication list and corresponding days' supply and places the onus on clinicians to determine days' supply to calculate the proportion of days covered. The commenter was concerned a lack of clarity and added administrative burden on physicians may disincentivize reporting of this quality measure if providers are unclear on the methodology for calculating adherence.

The commenter also stated in April 2024, NCQA released updates to the Adherence to Antipsychotic Medications for Individuals with Schizophrenia (SAA) measure.¹¹²¹ The commenter recommended that CMS align its proposed measure with the recently updated NCQA version. NCQA's updated measure clarifies the HCPCS codes J2794 and J2798 as 14 days' supply and 30 days' supply respectively; delete paliperidone palmitate from the "Long-acting injections 28 days' supply" row; and adds LAI products for 35 days (paliperidone palmitate – Invega Sustenna), 104 days (Paliperidone palmitate - Invega Trinza), and 201 days (Paliperidone palmitate - Invega Hafyera) supply to the LAI list. Alignment with the NCQA version of the measure will reduce burden and complexity and better align the measure across quality programs, including MIPS, Certified Community Behavior Health Centers Program, HEDIS®, and Medicaid.

Response: We thank the commenter for their feedback and concerns. The removal of days' supply and HCPCS (J codes) ensures inclusion of long-acting injectable medications as appropriate per the measure specification; therefore, permitting the clinician to obtain days' supply information from any appropriate clinical or administrative source, thus aligning the calculation of PDC with all appropriate medications listed in the measure. This revision reduces the burden of collecting this aspect of the measure from medical records. While we endeavor to align measures across reporting programs, there may be nuances within the program and/or collection type requirements that lead to small differences between specifications. The updated version of the specification removes the 'days' supply' requirement for each prescription, which should allow better flexibility in measure data capture.

¹¹²⁰ Cleveland Clinic. (2023). Antipsychotic Medications. <https://my.clevelandclinic.org/health/treatments/24692-antipsychotic-medications>.

¹¹²¹ NCQA. (2024). HEDIS Measurement Year 2024 Volume 2: Technical Update. <https://www.ncqa.org/wp-content/uploads/HEDIS-MY-2024-Volume-2-Technical-Update.pdf>.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62547), we are finalizing the changes to measure Q383 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.40. Adult Primary Rhegmatogenous Retinal Detachment Surgery: No Return to the Operating Room Within 90 Days of Surgery

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	384
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Patients aged 18 years and older who had surgery for primary rhegmatogenous retinal detachment who did not require a return to the operating room within 90 days of surgery.
Substantive Change:	Updated instructions: Revised: timeframe for when surgery for primary rhegmatogenous retinal detachment must have occurred to meet the denominator criteria. Updated numerator note: Added: For the purposes of meeting the numerator, complications are only those related to the following procedures: 67107, 67108, 67110.
Measure Steward:	American Academy of Ophthalmology
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale	We proposed to update the instructions to clarify that surgery for primary rhegmatogenous retinal detachment must occur between January 1 st and September 30 th of the performance period to allow 90 days after the surgery to assess for the numerator action for patients who have surgeries performed by September 30 th . We also proposed to add a numerator note to clarify that the numerator is not required to capture only procedures covered by the three original procedure codes in the denominator, but rather any procedure that is related to complications arising from the original procedures listed.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62548), we are finalizing the changes to measure Q384 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.41. Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	386
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients diagnosed with Amyotrophic Lateral Sclerosis (ALS) who were offered assistance in planning for end of life issues (e.g., advance directives, invasive ventilation, lawful physician-hastened death, or hospice) or whose existing end of life plan was reviewed or updated at least once annually or more frequency as clinically indicated (i.e., rapid progression).
Substantive Change:	Updated denominator criteria: Added: coding for speech language pathology.
Measure Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update the denominator criteria to include coding for speech language pathology and nuclear medicine as this measure is applicable to their scope of care.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q386: Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62548), we are finalizing the changes to measure Q386 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.42. Infection within 180 Days of Cardiac Implantable Electronic Device (CIED) Implantation, Replacement, or Revision

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	393
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Infection rate following CIED device implantation, replacement, or revision.
Substantive Change:	Updated instructions: Added: A new device would be either the first device OR a device implanted with new functionality.
Measure Steward:	American College of Cardiology Foundation
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale	We proposed to update the measure instructions to clarify the definition of a new device. This change will ensure alignment and consistency in the abstraction of the measure's elements that support rigorous data for the calculation of MIPS performance rates.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to update to the measure instructions for measure Q393: Infection within 180 Days of Cardiac Implantable Electronic Device (CIED) Implantation, Replacement, or Revision. The commenter agreed with CMS' rationale that the change would ensure alignment and consistency in the abstraction of the measure's elements that support rigorous data for the calculation of MIPS performance rates.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62548), we are finalizing the changes to measure Q393 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.43. Door to Puncture Time for Endovascular Stroke Treatment

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	413
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients undergoing endovascular stroke treatment who have a door to puncture time of 90 minutes or less.
Substantive Change:	Updated denominator exclusion: Added: Patients with secondary stroke within 5 days of the initial procedure.
Measure Steward:	Society of Interventional Radiology
High Priority Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale	We proposed to add a denominator exclusion to remove patients with secondary stroke, such as those which may occur with vasospasm in the setting of subarachnoid hemorrhage. Treatment for an initial stroke is most effective when administered very shortly after the onset of symptoms. ¹¹²² However, the same is not the case for secondary stroke which is more challenging to manage as patients with secondary stroke may already be on “blood thinners or aspirin, medication to control cholesterol, or drugs to lower blood pressure” as a result of the initial stroke and “experience more severe and long-lasting disability.” ¹¹²³ This additional exclusion will more precisely reflect the time to reperfusion for obtaining favorable outcomes in cerebral revascularization within the target patient population.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62549), we are finalizing the changes to measure Q413 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹²² Esenwa, C., & Gutierrez, J. (2015). Secondary Stroke Prevention: Challenges and Solutions. *Vascular Health and Risk Management*, 11, 437–450. <https://doi.org/10.2147/VHRM.S63791>.

¹¹²³ Medical News Today. (2023). Recurrent Strokes: What to Know. <https://www.medicalnewstoday.com/articles/recurrent-strokes>.

D.44. Osteoporosis Management in Women Who Had a Fracture

Category	Description
CBE # / eCQM CBE #:	0053 / N/A
Quality #:	418
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Measure Specifications / MIPS CQM Specifications
Current Measure Description:	The percentage of women 50–85 years of age who suffered a fracture and who had either a bone mineral density (BMD) test or prescription for a drug to treat osteoporosis in the six months after the fracture.
Substantive Change:	<p>The measure description is revised to read: For all collection types: The percentage of women 50–85 years of age who suffered a fracture and who had either a bone mineral density (BMD) test or prescription for a drug to treat osteoporosis in the 180 days after the fracture.</p> <p>Updated instructions: For all collection types: Revised: from six months to 180 days.</p> <p>Updated denominator exclusion: For all collection types: Removed: specific encounter requirements from the frailty/advanced illness exclusion.</p> <p>The measure numerator is revised to read: For all collection types: Patients who received either a bone mineral density test or a prescription for a drug to treat osteoporosis in the 180 days after the fracture.</p>
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale	<p>We proposed to use both 6 months and 180 days within the measure denominator and numerator to allow for the appropriate time anchors. In the denominator, 6 months is used so that the measurement period to identify a fracture is always July 1 – June 30 (during the 6 months prior to the performance period through June 30 of the performance period). The numerator action of administration of a bone mineral density test or a prescription for a drug to treat osteoporosis within a specific number of days (180 days after the date of a fracture) rather than months with varying number of days (e.g., 28 – 31 days).</p> <p>We proposed to update the denominator exclusion by removing the requirement for patients to have had at least one inpatient or two outpatient encounters to recognize a diagnosis of advanced illness. The removal of this requirement within the denominator exclusion reduces the burden of identifying applicable encounters, while still identifying patients with an indication of frailty. This is particularly applicable for those patients seen outside of their reporting clinician’s medical record. This revision will update the denominator exclusion to remove any patient 66–80 years of age and older who has a diagnosis of advanced illness during the measurement period or the year prior from the denominator of measure Q418. Decreasing complexity and burden of this element ensures consistent implementation allowing for more comparable data.</p>

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to the frailty exclusion criteria to measure Q418: Osteoporosis Management in Women Who Had a Fracture. The removal of the encounter criteria will reduce reporting burden while still following through with the intent of the exclusion for patients with an indication of frailty.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62550), we are finalizing the changes to measure Q418 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.45. Varicose Vein Treatment with Saphenous Ablation: Outcome Survey

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	420
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients treated for varicose veins (CEAP C2-S) who are treated with saphenous ablation (with or without adjunctive tributary treatment) that report an improvement on a disease specific patient reported outcome survey instrument after treatment.
Substantive Change:	Updated numerator definition: Added: Varicose Veins Symptom Questionnaire (VVSymQ) and Venous Clinical Severity Score (VCSS).
Measure Steward:	Society of Interventional Radiology
High Priority Measure:	Yes
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale	We proposed to revise the definition of an 'Outcome Survey' to include the VVSymQ and VCSS. These outcome surveys measure improvement for saphenous vein ablation and will allow clinicians more choices for meeting the numerator, which may encourage further adoption of this measure. ¹¹²⁴

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62551), we are finalizing the changes to measure Q420 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹²⁴ Paty, J., Turner-Bowker, D. M., Elash, C. A., & Wright, D. (2016). The VVSymQ® Instrument: Use of a New Patient-Reported Outcome Measure for Assessment of Varicose Vein Symptoms. *Phlebology*, 31(7), 481–488. <https://doi.org/10.1177/0268355515595193>.

D.46. Proportion of Patients Sustaining a Bladder Injury at the Time of any Pelvic Organ Prolapse Repair

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	432
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients undergoing pelvic organ prolapse repairs who sustain an injury to the bladder recognized either during or within 30 days after surgery.

<p>Substantive Change:</p>	<p>The measure title is revised from Proportion of Patients Sustaining a Bladder Injury at the Time of any Pelvic Organ Prolapse Repair to: Proportion of Patients Sustaining a Bladder or Bowel Injury at the time of any Pelvic Organ Prolapse Repair.</p> <p>The measure description is revised to read: Percentage of patients undergoing surgical repair of pelvic organ prolapse that is complicated by a bladder or bowel injury at the time of index surgery that is recognized intraoperatively or within 30 days after surgery.</p> <p>The measure instructions are revised to read: This measure is to be submitted each time an anterior, posterior, or apical prolapse repair surgery is performed from December 1st of the previous performance period through November 30th of the current performance period. There is no diagnosis associated with this measure. This measure may be submitted by Merit-based Incentive Payment System (MIPS) eligible clinicians who perform the quality actions described in the measure based on the services provided and the measure-specific denominator coding.</p> <p>This measure will be calculated with 2 performance rates:</p> <ol style="list-style-type: none"> 1) Percentage of patients undergoing prolapse repair who sustain a bladder injury that necessitates repair either intraoperatively or within 30 days after surgery. 2) Percentage of patients undergoing prolapse repair who sustain a bowel injury that necessitates repair either intraoperatively or within 30 days after surgery. <p>Submission of the two performance rates is required for this measure. A simple average, which is the sum of the performance rates divided by the number of the performance rates will be used to calculate performance.</p> <p>THERE ARE TWO SUBMISSION CRITERIA FOR THIS MEASURE:</p> <ol style="list-style-type: none"> 1) All patients undergoing anterior or apical pelvic organ prolapse (POP) surgery who sustain a bladder injury. 2) All patients undergoing anterior, posterior, or apical pelvic organ prolapse (POP) surgery who sustain a bowel injury. <p>This measure contains two submission criteria which together ensure that the proper evaluation and treatment is provided for patients who undergo pelvic organ prolapse repair. Submission Criteria 1 evaluates whether patients sustained a bladder injury intraoperatively or within 30 days after surgery. Submission Criteria 2 evaluates whether patients sustained a bowel injury intraoperatively or within 30 days after surgery. Patients who undergo a procedure that meets the denominator of both submission criteria should be included in both and assessed for each clinical outcome.</p> <p>Updated denominator: Added: SUBMISSION CRITERIA 2: All patients undergoing anterior, posterior, or apical pelvic organ prolapse (POP) surgery.</p> <p>Updated denominator criteria: Added: SUBMISSION CRITERIA 2: All patients, regardless of age AND Patient procedure during the denominator identification period WITHOUT Telehealth Modifier</p> <p>Updated definition: Added: SUBMISSION CRITERIA 1 & 2: Denominator identification period – the twelve month period in which eligible patients have a procedure, which December 1st of the previous performance period through November 30th of the current performance period.</p> <p>Updated numerator: Revised: SUBMISSION CRITERIA 1: Percentage of patients undergoing prolapse repair who sustain a bladder injury that necessitates repair either intraoperatively or within 30 days after surgery. Added: SUBMISSION CRITERIA 2: Percentage of patients undergoing prolapse repair who sustain a bowel injury that necessitates repair either intraoperatively or within 30 days after surgery.</p> <p>Update numerator instructions: Added: SUBMISSION CRITERIA 2: INVERSE MEASURE – A lower calculated performance rate for this measure indicates better clinical care or control. The “Performance Not Met” numerator option for this measure is the representation of the better clinical quality or control. Submitting that numerator option will produce a performance rate that trends closer to 0%, as quality increases. For inverse measures, a rate of 100% means all of the denominator eligible patients did not receive the appropriate care or were not in proper control.</p> <p>Updated numerator note: Added: SUBMISSION CRITERIA 2:</p>
-----------------------------------	--

Category	Description
	In order to meet the measure, bowel injury is sustained as a result of the prolapse surgery. Updated numerator options: Added: SUBMISSION CRITERIA 2: Performance Met: Patient sustained bowel injury at the time of surgery or discovered subsequently up to 30 days post-surgery OR Denominator Exception: Documented medical reasons for not reporting bowel injury (e.g. gynecologic or other pelvic malignancy documented, planned (e.g. not due to an unexpected bowel injury) resection and/or re-anastomosis of bowel, or patient death from non-medical causes not related to surgery, patient died during procedure without evidence of bowel injury) OR Performance Not Met: Patient did not sustain a bowel injury at the time of surgery nor discovered subsequently up to 30 days post-surgery
Measure Steward:	American Urogynecologic Society
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale	We proposed to revise this measure to add a submission criteria and performance rate for patients who retain a bowel injury at the time of any pelvic organ prolapse repair. We proposed to add submission criteria two to evaluate all patients undergoing anterior, posterior, or apical pelvic organ prolapse surgery who sustain a bowel injury. Previously, assessment of bowel injury outcomes for POP procedures was a separate measure. As both measures are assessing for adverse outcomes following POP procedures, these measures are being combined so that a full picture of adverse outcomes can be captured for this patient population. Additionally, by combining these measures, the denominator eligible patient population may increase allowing for more robust data for participating MIPS clinicians. We also proposed to add a definition for the denominator identification period of December 1st of the previous performance period through November 30th of the current performance period. In the event the proposed substantive change(s) are finalized, the substantive changes will not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes. As such, if the performance data submitted meets the criteria for creation of a performance period benchmark, a new benchmark will be used for scoring.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q432: Proportion of Patients Sustaining a Bladder Injury at the Time of any Pelvic Organ Prolapse Repair to include both bladder and bowel injury.

Response: We thank the commenter for supporting the substantive changes to this measure.

For the reasons stated above and in the proposed rule (89 FR 62552 through 62554), we are finalizing the changes to measure Q432 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.47. Appropriate Workup Prior to Endometrial Ablation

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	448
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients, aged 18 years and older, who undergo endometrial sampling or hysteroscopy with biopsy and results are documented before undergoing an endometrial ablation.
Substantive Change:	Updated the instructions: Revised: submission of the measure to once per performance period.
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to change the frequency of this measure from each time a procedure for endometrial ablation is performed to once per performance period, as this is more aligned with the clinical action being assessed for this measure.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62554), we are finalizing the changes to measure Q448 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.48. Appropriate Treatment for Patients with Stage I (T1c) - III HER2 Positive Breast Cancer

Category	Description
CBE # / eCQM CBE #:	1858 / N/A
Quality #:	450
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of female patients aged 18 to 70 with stage I (T1c) - III HER2 positive breast cancer for whom appropriate treatment is initiated.
Substantive Change:	<p>The measure description is revised to read: Percentage of patients aged 18 to 70 with stage I (T1c) – III HER2 positive breast cancer for whom appropriate treatment is initiated.</p> <p>The measure denominator is revised to read: All breast cancer patients aged 18 to 70 with pathologic stage I (T1c) – III HER2 positive breast cancer diagnosed between July 1st of the previous performance period through June 30th of the current performance period.</p> <p>Updated denominator instructions: Added: For the purposes of this measure, only pathologic staging and HER-2 testing performed between July 1st of the previous performance period through June 30th of the current performance period will be included in the denominator of this measure.</p> <p>Updated denominator note: Added: This measure includes both female and male breast cancers. While treatment recommendations for males have largely been extrapolated from results of clinical trials focused on breast cancer in females, management of breast cancer in males is similar in overall management to breast cancer in females. Consistent with guidance in National Comprehensive Cancer Network (NCCN) guideline recommendations for adjuvant systemic therapy, chemotherapy with/without HER2-targeted therapy should be recommended for males with breast cancer according to guidelines for females with breast cancer.</p> <p>Updated denominator criteria: Revised: Patients age 18-70 years on date of encounter Added: diagnosis codes for male breast cancer. Added: Diagnosis of breast cancer between July 1st of the previous performance period through June 30th of the current performance period.</p> <p>Updated numerator note: Added: The timeframe to identify the adjuvant treatment course is within six months of breast cancer pathologic staging. To satisfy the numerator, both chemotherapy and HER2-targeted therapy must occur within six months of pathologic staging.</p>
Measure Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Process
Rationale	<p>We proposed to update multiple components of this measure to ensure that all patients diagnosed with breast cancer are included in the measure’s denominator. While treatment recommendations for males have largely been extrapolated from results of clinical trials focused on breast cancer in females,¹¹²⁵ management of breast cancer in males is similar in overall management to breast cancer in females. Consistent with guidance in NCCN recommendations for adjuvant systemic therapy, chemotherapy with/without HER2-targeted therapy should be recommended for males with breast cancer according to guidelines for females with breast cancer.¹¹²⁶</p> <p>Additionally, revisions to the denominator definition will clarify the timeframe in which pathologic staging and HER-2 testing should be performed for patient to be included in the denominator. We also proposed revisions to the numerator note to further clarify definition of and timeframe for when adjuvant treatment, for the purposes of this measure, should occur relative to pathologic staging.</p>

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62555), we are finalizing the changes to measure Q450 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.49. RAS (KRAS and NRAS) Gene Mutation Testing Performed for Patients with Metastatic Colorectal Cancer who Receive Anti-epidermal Growth Factor Receptor (EGFR) Monoclonal Antibody Therapy

Category	Description
CBE # / eCQM CBE #:	1859 / N/A
Quality #:	451
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of adult patients (aged 18 or over) with metastatic colorectal cancer who receive anti-epidermal growth factor receptor monoclonal antibody therapy for whom RAS (KRAS and NRAS) gene mutation testing was performed.
Substantive Change:	Updated denominator instructions: Added: The denominator of this measure is intended to capture newly diagnosed stage IV patients or patients who have distant metastases at the time of colon cancer diagnosis. For the purposes of this measure, the patient's initial diagnosis may occur between December 1 of the prior year through November 30 of the performance period, and anti-EGFR monoclonal antibody therapy may occur between December 1 of the prior year through December 31 of the performance period.
Measure Steward:	American Society of Clinical Oncology
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to add denominator instructions to clarify that only patients who have been newly diagnosed with Stage IV colorectal cancer or patients who have distant metastases at the time of colon cancer diagnosis are to be captured in the denominator of the measure. This will ensure that the appropriate patient population is assessed for the numerator action.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62556), we are finalizing the changes to measure Q451 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.50. Bone Density Evaluation for Patients with Prostate Cancer and Receiving Androgen Deprivation Therapy

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	462
CMS eCQM ID:	CMS645v8
Current Collection Type:	eCQM Specifications
Current Measure Description:	Patients determined as having prostate cancer who are currently starting or undergoing androgen deprivation therapy (ADT), for an anticipated period of 12 months or greater and who receive an initial bone density evaluation. The bone density evaluation must be prior to the start of ADT or within 3 months of the start of ADT.
Substantive Change:	The measure denominator is revised to read: Patients with a qualifying encounter in the measurement period AND with a diagnosis of prostate cancer AND with an order for ADT or an active medication of ADT with an intent for treatment greater than or equal to 12 months during the measurement period AND order for ADT in 3 months before to 9 months after the start of the measurement period.
Measure Steward:	Oregon Urology Institute
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to expand the denominator to include all patients regardless of gender. This revision broadens the denominator population to capture all patients with a diagnosis of prostate cancer who are receiving androgen deprivation therapy and ensure a bone density evaluation is completed prior to the start of treatment. As significantly lower PSA screening rates were seen among transgender individuals for ages 40-54 and 55-69, but higher rates within the age group 70-80 ($P < .001$ for all), ¹¹²⁷ broadening the denominator will ensure these patient populations are being screened in accordance with current clinical guidelines.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62557), we are finalizing the changes to measure Q462 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹²⁷ Premo, H., Gordee, A., Lee, H. J., Scales, C. D., Moul, J. W., & Peterson, A. (2023). Disparities in Prostate Cancer Screening for Transgender Women: An Analysis of the MarketScan Database. *Urology*, 176, 237–242. <https://doi.org/10.1016/j.urology.2023.03.016>.

D.51. Otitis Media with Effusion: Systemic Antimicrobials - Avoidance of Inappropriate Use

Category	Description
CBE # / eCQM CBE #:	0657 / N/A
Quality #:	464
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 2 months through 12 years with a diagnosis of OME who were not prescribed systemic antimicrobials.
Substantive Change:	The measure instructions are revised to read: This measure is to be submitted once for each occurrence of otitis media with effusion (OME) in children seen during the performance period. Each unique occurrence starts with the onset of OME symptoms and concludes with the resolution of OME or after 90 days if a resolution of OME symptoms is not documented. If multiple encounters are documented within an occurrence, Merit-based Incentive Payment System (MIPS) eligible clinicians should submit the most recent encounter during that occurrence. A new occurrence of OME cannot start until the previous occurrence during the performance period has concluded.
Measure Steward:	American Academy of Otolaryngology – Head and Neck Surgery Foundation
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update the measure instructions to clarify what constitutes an occurrence for the purposes of this measure. This additional guidance will further clarify how patients are attributed to the denominator of this measure for each eligible occurrence. This change will ensure consistency in the abstraction of the measure's elements that support rigorous data for the calculation of MIPS performance rates.

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62558), we are finalizing the changes to measure Q464 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.52. Functional Status After Primary Total Knee Replacement

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	470
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	For patients age 18 and older who had a primary total knee replacement procedure, functional status is rated by the patient as greater than or equal to 37 on the Oxford Knee Score (OKS) or a 71 or greater on the KOOS, JR. tool at one year (9 to 15 months) postoperatively.
Substantive Change:	Updated numerator note: Revised: list of situations that denote performance not met.
Measure Steward:	Minnesota Community Measurement
High Priority Measure:	Yes
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale	We proposed to revise the numerator note by clarifying that if a tool other than the Oxford Knee Score (OKS) or Knee injury/Osteoarthritis Outcome Score Joint Replacement (KOOS, JR.) is used to assess a patient's functional status for this measure, it will result in a performance not met. The requirements for meeting this measure require use of the specific tools referenced in the measure specification, as they have been tested, validated, and determined to be most appropriate for capturing the numerator action.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q470: Functional Status After Primary Total Knee Replacement. The commenter requested clarification if a tool other than the Oxford Knee Score (OKS) or Knee injury/Osteoarthritis Outcome Score Joint Replacement (KOOS, JR.) is used to assess a patient's functional status, this should result in a performance not met.

Response: We thank the commenter for supporting the substantive changes to this measure. Currently this measure is prescriptive as to the tools that can be utilized to meet performance; however, we encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62558), we are finalizing the changes to measure Q470 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.53. Psoriasis – Improvement in Patient-Reported Itch Severity

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	485
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	The percentage of patients aged 8 years and older, with a diagnosis of psoriasis where at an initial (index) visit have a patient-reported itch severity assessment performed, score greater than or equal to 4, and who achieve a score reduction of 3 or more points at a follow-up visit.
Substantive Change:	<p>Updated denominator note: Added: The initial (index) visit assessment and the follow-up visit for assessment must occur during the performance period. The initial (index) visit is the first encounter with the patient during the performance period. Every visit after the initial (index) visit during the performance period is a follow-up visit. An assessment should be completed at each visit.</p> <p>Updated numerator instructions: Removed: If a patient has multiple follow-up visits within the measurement period, the last (most recent) visit should be used.</p>
Measure Steward:	American Academy of Dermatology
High Priority Measure:	Yes
Measure Type:	Patient-reported Outcome-based Performance Measure
Rationale	We proposed to update the denominator note to clarify encounter timing by including language outlining that a patient's first visit during the measurement period is considered the initial (index) encounter. Each visit after the initial (index) visit during the measurement period will be deemed a follow-up visit used to determine the outcome of the measure. This change will ensure consistency in the abstraction of the measure's elements that support rigorous data for the calculation of MIPS performance rates.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q485: Psoriasis – Improvement in Patient-Reported Itch Severity.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62559), we are finalizing the changes to measure Q485 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.54. Dermatitis – Improvement in Patient-Reported Itch Severity

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	486
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	The percentage of patients aged 8 years and older, with a diagnosis of dermatitis where at an initial (index) visit have a patient-reported itch severity assessment performed, score greater than or equal to 4, and who achieve a score reduction of 3 or more points at a follow-up visit.
Substantive Change:	<p>Updated denominator note: Added: The initial (index) assessment and the follow-up visit for assessment must occur during the performance period. The initial (index) visit is the first encounter with the patient during the performance period. Every visit after the initial (index) visit during the performance period is a follow-up visit. An assessment should be completed at each visit.</p> <p>Updated numerator instructions: Removed: If a patient has multiple follow-up visits within the measurement period, the last (most recent) visit should be used.</p>
Measure Steward:	American Academy of Dermatology
High Priority Measure:	Yes
Measure Type:	Patient-Reported Outcome-based Performance Measure
Rationale	We proposed to update the denominator note to clarify encounter timing by including language outlining that a patient's first visit during the measurement period is considered the initial (index) encounter. Each visit after the initial (index) visit during the measurement period will be deemed a follow-up visit used to determine the outcome of the measure. This change will ensure consistency in the abstraction of the measure's elements that support rigorous data for the calculation of MIPS performance rates.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q486: Dermatitis – Improvement in Patient-Reported Itch Severity.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62559), we are finalizing the changes to measure Q486 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.55. Kidney Health Evaluation

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	488
CMS eCQM ID:	CMS951v3
Current Collection Type:	eCQM Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of patients aged 18-75 years with a diagnosis of diabetes who received a kidney health evaluation defined by an Estimated Glomerular Filtration Rate (eGFR) AND Urine Albumin-Creatinine Ratio (uACR) within the measurement period.
Substantive Change:	<p>Updated description: For all collection types: Revised: patients aged 18-85 years.</p> <p>Updated denominator: For all collection types: Revised: patients aged 18-85 years.</p> <p>Updated denominator criteria: For the MIPS CQM Specifications collection type: Revised: patients aged 18-85 years.</p>
Measure Steward:	National Kidney Foundation
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the age from 18-75 to 18-85 years of age for denominator eligibility. Based on information from National Institutes of Health states, "A high proportion of older CKD patients are usually affected by multimorbidity, polypharmacy, frailty, functional and cognitive impairment, and disability." ¹¹²⁸ "The benefits of preventing/slowing the progression of CKD has the potential to impact different social and health domains, for example, reducing the need for long-term care and the cost related to caregiving." ¹¹²⁹ Increasing the denominator age criteria support the reporting of clinicians currently screening a broader elderly population for this preventable disease.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to adjust the upper age range from 75 to 85 years old to promote screening for a broader elderly population to measure Q488: Kidney Health Evaluation. Kidney health evaluation, which begins with appropriate, clinically adherent screening, is essential to identifying CKD at early stages and increases the likelihood of successful intervention.

Response: We thank the commenter for supporting the substantive changes to this measure.

Comment: One commenter opposed the age extension from 75 to 85 years to measure Q488. The commenter stated most older adults, with or without diabetes mellitus, will have annual serum creatinine assessments due to their frequent contact with the healthcare system and ubiquitous blood testing, including the basic and comprehensive metabolic panels. Therefore, this measure specification change effectively impacts the addition of annual urine microalbumin creatinine ratio (uMAC) testing. Due to abundant serum creatinine testing, clinicians and patients are likely to be aware of renal decline in those 76 to 85 years of age and beyond, without a uMAC result. The commenter indicated that this proposed change would force clinicians to order and communicate the results of a test that in most cases they should not order or act on.

Response: We appreciate the concerns expressed by the commenter. The extension of the age to 85 years will encourage annual kidney health evaluations in older adults with diabetes to assess for kidney function and kidney damage. These recommended blood and urine kidney tests forge an intentional focus on early detection and improved kidney care. The National Kidney Foundation recommends annual testing for patients with certain risk factors, including diabetes and being over the age of 60.¹¹³⁰

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62560), we are finalizing the changes to measure Q488 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.56. Appropriate Intervention of Immune-Related Diarrhea and/or Colitis in Patients Treated with Immune Checkpoint Inhibitors

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	490
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients, aged 18 years and older, with a diagnosis of cancer, on immune checkpoint inhibitor therapy, and grade 2 or above diarrhea and/or grade 2 or above colitis, who have immune checkpoint inhibitor therapy held and corticosteroids or immunosuppressants prescribed or administered.
Substantive Change:	Updated denominator definition: For the MIPS CQM Specifications collection type: Added: immune checkpoint inhibitors Lag-3 inhibitor drug: Relatlimab; and Tremelimumab to CTLA-4 inhibitor drugs.
Measure Steward:	Society for Immunotherapy of Cancer (SITC)
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the denominator definition to add new Food and Drug Administration (FDA) approved checkpoint inhibitors, Relatlimab and Tremelimumab. These inhibitors are clinically appropriate to include in the denominator of this measure. ^{1131 1132}

We received no public comments on the substantive changes proposed for this measure. For the reasons stated above and in the proposed rule (89 FR 62561), we are finalizing the changes to measure Q490 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹³² FDA. (2022). FDA Approves Opdualag for Unresectable or Metastatic Melanoma. <https://www.fda.gov/drugs/resources-information-approved-drugs/fda-approves-opdualag-unresectable-or-metastatic-melanoma>.

D.57. Risk-Standardized Acute Cardiovascular-Related Hospital Admission Rates for Patients with Heart Failure under the Merit-based Incentive Payment System

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	492
CMS eCQM ID:	N/A
Current Collection Type:	Administrative Claims
Current Measure Description:	Annual risk-standardized rate of acute, unplanned cardiovascular-related admissions among Medicare Fee-for-Service (FFS) patients aged 65 years and older with heart failure (HF) or cardiomyopathy.
Substantive Change:	Updated: Reporting Requirements: Removed: individual reporting.
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale	<p>We proposed a substantive change to this measure that will be applied retroactively starting with the CY 2023 performance period/2025 MIPS payment year. In the CY 2023 PFS final rule, we inadvertently specified the measure was available at the individual clinician level. The inclusion of the availability of the measure at the individual clinician level is a misrepresentation and erroneously conveys to MIPS eligible clinicians reporting at the individual clinician level that the measure is available to meet the minimum required number of measures to report under traditional MIPS or an MVP. The measure was tested and developed for implementation at the group, virtual group, subgroup via an MVP, and APM Entity levels. Thus, the measure is limited to groups, virtual groups, subgroups via an MVP, and APM Entities participating in MIPS. A failure to apply this substantive change retroactively will be contrary to the public interest.</p> <p>Prior to the finalization of this measure as a new measure available within the MIPS quality measure inventory in the CY 2023 PFS final rule, the measure was initially proposed as a new measure in the CY 2022 PFS proposed rule. Based on the public comments received in response to the initial proposal of this measure in the CY 2022 PFS proposed rule, there were concerns regarding the attribution of certain patients to clinicians, particularly the risk adjustment for clinicians with higher caseloads of patients with more complicated or severe heart failure. As a result, the measure was not finalized as part of the CY 2022 PFS final rule; however, we noted that we will continue to consider how to implement condition-specific measures such as this measure under MIPS (86 FR 65692 through 65694).</p> <p>In the CY 2023 PFS proposed rule, we re-proposed this measure, which mitigated the concerns regarding the attribution of such patients to clinicians by excluding patients at advanced stages of heart failure and requiring that a group, virtual group, subgroup via an MVP, and APM Entity to include at least 1 cardiologist (and a 21-patient case minimum); and subsequently, the measure was finalized in the CY 2023 PFS final rule (87 FR 70266) through 70271). The intent of the measure is for assessment of performance to be conducted at the group, virtual group, subgroup via an MVP, and APM Entity levels. The measure was not tested, developed, or implemented at the individual clinician level. In order for this measure to be available at the individual clinician level, the measure will need to be tested at the individual clinician level to establish validity, reliability, and risk adjustments at the individual clinician level. It is not appropriate for the measure to be available at the individual clinician level without further testing. Consequently, any assessment of data for this measure at the individual clinician level will produce invalid and unreliable results. By retroactively applying the substantive change to this measure (modifying the measure to remove the individual clinician level as an option) effective starting with the CY 2023 performance period/2025 MIPS payment year, the level of reporting available for the measure will align with the intent, implementation, and operationalization of the measure, and clarify that the measure is not available at the individual clinician level.</p>

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q492: Risk-Standardized Acute Cardiovascular-Related Hospital Admission Rates for Patients with Heart Failure under the Merit-based Incentive Payment System and was pleased that CMS acknowledged that this measure’s application at the individual clinician level could result in invalid and unreliable results, given that it has not been tested. A second commenter supported the proposed substantive change as it ensures accuracy and validity by using the measure as intended. The change also aligns the measure's use with its tested and developed levels, namely groups, virtual groups, subgroups, and APM Entities.

Response: We thank the commenters for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62562), we are finalizing the changes to measure Q492 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.58. Adult Immunization Status

Category	Description
CBE # / eCQM CBE #:	3620 / N/A
Quality #:	493
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients 19 years of age and older who are up-to-date on recommended routine vaccines for influenza; tetanus and diphtheria (Td) or tetanus, diphtheria and acellular pertussis (Tdap); zoster; and pneumococcal.
Substantive Change:	Updated instructions: Revised: pneumococcal vaccine on or after their 19th birthday. Updated numerator: Revised: Submission Criteria 4: pneumococcal vaccine on or after their 19th birthday.
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the measure instructions and numerator to lower the minimum age from 60 years of age to 19 years of age. This revision aligns with the updated ACIP pneumococcal vaccination guidelines ¹¹³³ that recommend administering conjugate vaccines to all adults with certain underlying medical conditions. In the CY 2023 PFS final rule, this measure was finalized, and it was noted that the scoring of the measure will use a weighted average for the first 2 years of implementation; and starting with the CY 2025 performance period/2027 MIPS payment year, the measure will be scored as an all-or-none composite measure to ensure a more thorough assessment of a patient's vaccination status (87 FR 70272 through 70274). However, based upon an analysis of preliminary data submitted for the CY 2023 performance period, low measure adoption, and feedback received through Quality Payment Program Service Now tickets regarding burden of implementation and ability to meet performance on all four components, we proposed to maintain the weighted average analytic for the CY 2025 performance period and subsequent years as determined by CMS. The utilization of the weighted average metric/analytic beyond 2 years will provide clinicians with more time to prepare for the transition to a more stringent all-or-none metric/analytic, which will require a complete vaccination history to meet numerator compliance.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported revisions to measure Q493: Adult Immunization Status to align with ACIP recommendations, such as the proposal to update the numerator instructions lowering the minimum age for pneumococcal vaccinations. The commenter encouraged CMS to continue refinements of the Adult Immunization Status measure in accordance with up-to-date ACIP recommendations, and to create consistency of the measure specifications with updates made by the measure steward, NCQA, related to removing the herpes zoster live (ZVL) vaccine from the herpes zoster immunization indicator, and adding a hepatitis B immunization indicator.

The commenter indicated it is important for CMS to create consistencies of this measure in MIPS and across other reporting structures, given the broad uptake of this measure in quality reporting programs and MVPs. The commenter also acknowledged the challenges some clinicians have faced in meeting the performance requirements for all four vaccine indicators under measure Q494 and suggested tracking individual vaccine performance under this measure.

Response: We thank this commenter for supporting the substantive changes to this measure. We appreciate the commenters feedback. We strive to align measures across quality reporting programs as much as possible and encourage measure stewards to propose refinements to keep the measures up to date. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years, such as tracking individual performance under this measure. This measure will retain its weighted average analytic as we are delaying the transition to an all-or-none analytic to a future year.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62563), we are finalizing the changes to measure Q493 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

Pneumococcal Vaccine for Adults Aged ≥ 19 Years: Recommendations of the Advisory Committee on Immunization Practices, United States, 2023. *MMWR. Recommendations and Reports: Morbidity and Mortality Weekly Report. Recommendations and Reports*, 72(3), 1–39. <https://doi.org/10.15585/mmwr.rr7203a1>.

D.59. Preventive Care and Wellness (composite)

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	497
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients who received age- and sex-appropriate preventive screenings and wellness services. This measure is a composite of seven component measures that are based on recommendations for preventive care by the U.S. Preventive Services Task Force (USPSTF), Advisory Committee on Immunization Practices (ACIP), American Association of Clinical Endocrinology (AACE), and American College of Endocrinology (ACE).
Substantive Change:	<p>Updated instructions: Updated: Percentage of patients 65 years of age or older who received a pneumococcal vaccination on or after their 19th birthday.</p> <p>Updated denominator exclusion: Removed: (Submission Criteria 3 and Submission Criteria 4): specific encounter requirements from the frailty/advanced illness exclusion.</p> <p>Updated denominator criteria: Added: (Submission Criteria 7) coding for nutrition/dietitian clinician type.</p> <p>Updated numerator definition: Revised: intervals for rescreening for first and second hypertensive BP readings.</p>
Measure Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	No
Measure Type:	Process
Rationale	<p>We proposed to update the measure instructions for patients 65 years of age and older who have received a pneumococcal vaccination on or after their 19th birthday. This update will allow for the identification of patients 65 years of age and older who may have a clinical condition that will make them a candidate to receive the pneumococcal vaccine prior to 65 years of age.¹¹³⁴</p> <p>We proposed to add encounter codes for nutrition therapy to the denominator criteria as this is an appropriate setting to identify people who may have elevated blood pressure (BP) readings. Nutritional approaches play a pivotal role in helping to reduce the risk of hypertension or control blood pressure in people with hypertension.¹¹³⁵</p> <p>We proposed to remove the minimum timeframe for follow-up screenings for patients with elevated BP readings. This change allows clinician discretion to recommend a follow-up plan based on the patient’s current health status. Additionally, this supports stability of this measure component, as the frequency is each visit, within the specification over time, while still maintaining consistency with the current guidelines.¹¹³⁶</p> <p>We proposed to update the denominator exclusion by removing the requirement for patients to have had at least one inpatient or two outpatient encounters to recognize a diagnosis of advanced illness. The removal of this requirement within the denominator exclusion reduces the burden of identifying applicable encounters, while still identifying patients with an indication of frailty. This is particularly applicable for those patients seen outside of their reporting clinician’s medical record. This revision will update the denominator exclusion to remove any patient 66 years of age and older who has a diagnosis of advanced illness during the measurement period or the year prior from the denominator for submission criteria 3 and submission criteria 4 of measure Q497.</p>

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to the frailty exclusion criteria to measure Q497: Preventive Care and Wellness (composite). The removal of the encounter criteria will reduce reporting burden while still following through with the intent of the exclusion for patients with an indication of frailty.

Response: We thank the commenter for supporting the substantive changes to this measure

Comment: One commenter appreciated that measure Q497 was updated to improve data capture and ensure that it is aligned with evidence but remained concerned on the complexity of the measure and its inclusion in MIPS.

Response: We thank the commenter for supporting the substantive changes to this measure. By setting a more stringent performance standard through use of a single composite measure compared to the prior framework, under which each quality action was reported through a separate quality measure, we will gain a better picture of overall preventive care practices as each

¹¹³⁴ See footnote Kobayashi et al., 2023 in Table D.58 of this Appendix.

¹¹³⁵ See footnote Physicians Committee for Responsible Medicine, 2023 in Table D.28 of this Appendix.

¹¹³⁶ See footnote Whelton et. al., 2018 in Table D.28 of this Appendix.

component is important to either prevention of or early detection of disease (<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4678940/>). We maintained two of the component measures, Q226: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention and Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented, in select specialty measure sets due to the importance of those clinical concepts to specialties where the composite measure would not be applicable, and we maintained measure Q493: Adult Immunization Status for use within traditional MIPS.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62564), we are finalizing the changes to measure Q497 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.60. Connection to Community Service Provider

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	498
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percent of patients 18 years or older who screen positive for one or more of the following health related social needs (HRSNs): food insecurity, housing instability, transportation needs, utility help needs, or interpersonal safety; and had contact with a Community Service Provider (CSP) for at least 1 of their HRSNs within 60 days after screening.
Substantive Change:	Updated denominator criteria: Added: coding for Dentistry, Emergency Medicine, Inpatient, Nuclear Medicine, Interventional Radiology, Psychiatry, Mental and Behavioral Health, Nephrology, Nutrition/Dietician, Obstetrics/Gynecology, Ophthalmology, Otolaryngology, Physical Therapy/Occupational Therapy, Home Care and Skilled Nursing.
Measure Steward:	OCHIN
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to update the denominator criteria to include coding for multiple patient services as this measure is applicable to the scope of care associated with these services. Clinicians treating patients within these services have an opportunity for screening for HRSNs and connecting with an appropriate CSP. Addressing the social determinants is an important and emerging area of practice that entails starting earlier and broadening the scope of interventions, thus making entire families and communities healthier. ¹¹³⁷

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to include medical nutrition therapy codes in the denominator criteria to measure Q498: Connection to Community Service Provides that underscores the crucial role RDNs play in screening for health-related social needs and connecting patients with appropriate community service providers. One commenter appreciated the addition of coding for physical therapy. Two additional commenters supported the proposed substantive changes to measure Q498.

Response: We thank the commenters for the supporting substantive changes to this measure.

Comment: One commenter did not support expanding the measure's coding to measure Q498 to be attributed to the additional specialties under the substantive change. The commenter supported the measure's intent, but continued to oppose its inclusion in MIPS, stating that measures must be evidence-based and facilitate improvements in patient care. The commenter continued to see a lack of any evidence supporting the measure, or any testing been provided to demonstrate the measure's reliability and validity. By expanding to additional specialties without sufficient testing at the individual clinician level, the commenter believed that CMS increases the potential for unintended negative consequences, and as a result, the commenter did support the measure or this expansion in MIPS or MVPs.

The commenter remained concerned that clinicians will be unable to address their patient needs due to the lack of resources and tools that are widely and readily available to clinicians and practices. The availability of resources will also be dependent on the patient's locality and the type of service needed. The commenter expressed that the measure should continue to align with the work of the HL 7 Gravity Project and the United States Core Data for Interoperability (USCDI). The commenter also voiced that to continue to include social needs-related measures in MIPS along with all the CMS quality programs without a comprehensive strategy on the best approach for physicians and clinicians to address the problem will exacerbate inequities and runs the risk of deteriorating the physician-patient relationship.

Response: We acknowledge the commenters concerns with this measure; however, we disagree with the commenter that this measure is not evidence-based. Studies have shown that social needs can create significant barriers to patients receiving and achieving high quality of care and can also contribute to poorer health.¹¹³⁸ Systematically screening patients for social drivers of health and referring them to community-based resources as needed can result in improved health outcomes.¹¹³⁹ Furthermore, improving the clinician's understanding of the social obstacles their patients face beyond the clinical realm – but which may

M., McCandless, B. M., Nalitt, B. R., Viswanathan, L., Murphy, C. J., Azah, A. M., & Marks, L. (2018). Addressing Social Determinants to Improve Patient Care and Promote Health Equity: An American College of Physicians Position Paper. *Annals of Internal Medicine*, 168(8), 577–578. <https://doi.org/10.7326/M17-2441>.

¹¹³⁹ See footnote Daniel et al., 2018.

affect their clinical outcomes – can provide critical insights, catalyze prevention and/or early identification and prompt referral, improve a patient’s overall health and well-being.¹¹⁴⁰

While we agree availability of resources may be a challenge in some areas, with the increase in telehealth and virtual networking, the CSP need not be in the general area to provide assistance. Through different programs, CSPs can identify and work with the proper resources to reduce social stressors for patients and clinicians. We acknowledge that due to nuances in clinician specialization, scope of care, or regional location, not all measures within MIPS will be applicable or appropriate to all clinicians within that specialty set umbrella. However, no measures within traditional MIPS are required. MIPS provides clinician choice to account for these nuances, while ensuring clinicians can choose measures that are most meaningful to their scope of care and patient case-mix.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62565), we are finalizing the changes to measure Q498 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.61. Acute Posterior Vitreous Detachment Appropriate Examination and Follow-up

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	500
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients with a diagnosis of acute posterior vitreous detachment (PVD) in either eye who were appropriately evaluated during the initial exam and were re-evaluated no later than 8 weeks.
Substantive Change:	Updated denominator criteria: Added: acute PVD. Removed: coding for non-acute disorders related to PVD.
Measure Steward:	American Society of Retina Specialists
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to revise the denominator criteria by removing diagnosis codes for non-acute PVD and adding acute PVD within the criteria of the denominator. The ICD-10-CM PVD diagnosis codes do not differentiate between acute and non-acute disorders of vitreous detachment; therefore, to ensure the intended patient population is identified, the denominator criteria must be specific to acute PVD.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter provided comments related to proposed substantive changes proposed to measure Q500: Acute Posterior Vitreous Detachment Appropriate Examination and Follow-up and measure Q501: Acute Posterior Vitreous Detachment and Acute Vitreous Hemorrhage Appropriate Examination and Follow-up (see Table D.62 of this Appendix). The commenter requested guidance on what specific coding will be added to indicate acute PVD. Currently, the measure specification for measure Q500 does not require a HCPCS code for acute PVD, while the measure specification for measure Q501 does. The commenter requested that the coding requirements be consistent for these two measures.

Currently, the 2024 measure specifications for measures Q500 and Q501 both have the following definition of acute PVD specified in the Denominator section “Acute PVD – For the purposes of this measure, acute PVD and vitreous hemorrhage is defined as recent onset of 30 days or less. For PVD, acute can be documented as new onset vitreous separation or vitreous detachment.” This indicates these measures could be mapped to keywords for reporting, rather than relying on coding. The commenter requested that CMS allow providers to use either the HCPCS code or the field mapping to identify the patient population. Since a significant percentage of clinicians do not use the acute PVD HCPCS code, there will need to be significant education required to implement new practices should the code be required for these measures in 2025. Therefore, in addition to making the denominator requirements the same for measures Q500 and Q501, the commenter requested that CMS clarify and clearly communicate what the coding changes for these measures will be prior to December 2024. This would allow time to educate clients and members to ensure they are able to code appropriately for these measures for a full year starting on January 1, 2025.

Response: We thank the commenters for their feedback. The specific coding will be listed in the measure specifications along with the Single Source document which will be posted in December.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62566), we are finalizing the changes to measure Q500 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.62. Acute Posterior Vitreous Detachment and Acute Vitreous Hemorrhage Appropriate Examination and Follow-up

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	501
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of patients with a diagnosis of acute posterior vitreous detachment (PVD) and acute vitreous hemorrhage in either eye who were appropriately evaluated during the initial exam and were re-evaluated no later than 2 weeks.
Substantive Change:	Updated denominator criteria: Removed: coding for non-acute disorders related to PVD.
Measure Steward:	American Society of Retina Specialists
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to revise the denominator criteria by removing diagnosis codes for non-acute PVD and adding acute PVD within the criteria of the denominator. The ICD-10-CM PVD diagnosis codes do not differentiate between acute and non-acute disorders of vitreous detachment; therefore, to ensure the intended patient population is identified, the denominator criteria must be specific to acute PVD.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: As indicated under Table D.61 of this Appendix, one commenter requested guidance on what specific coding will be added to indicate acute PVD to measures Q500: Acute Posterior Vitreous Detachment Appropriate Examination and Follow-up and Q501: Acute Posterior Vitreous Detachment and Acute Vitreous Hemorrhage Appropriate Examination and Follow-up.

Response: Please see our response to this commenter under Table D.61 of this Appendix.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62566), we are finalizing the changes to measure Q501 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.63. Gains in Patient Activation Measure (PAM®) Scores at 12 Months

Category	Description
CBE # / eCQM CBE #:	2483 / N/A
Quality #:	503
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	The Patient Activation Measure® (PAM®) is a 10- or 13- item questionnaire that assesses an individual's knowledge, skills and confidence for managing their health and health care. The measure assesses individuals on a 0-100 scale that converts to one of four levels of activation, from low (1) to high (4). The PAM® performance measure (PAM®-PM) is the change in score on the PAM® from baseline to follow-up measurement.
Substantive Change:	<p>Updated instructions: Revised: follow-up PAM® survey collected on at least 25% of all eligible patients within 4 to 12 months of the baseline during the performance period.</p> <p>The measure denominator is revised to read: For Submission Criteria 1: Patients aged 14 years and older with at least two qualifying visits during the performance period. For Submission Criteria 2, 3 & 4: Patients aged 14 years and older with Performance Met for Submission Criteria 1 who had a baseline PAM® score and a second score within 4 to 12 month of baseline PAM® score and who were seen for a qualifying visit at least twice during the performance period.</p> <p>Updated denominator criteria: Revised: For Submission Criteria 2, 3, & 4: follow-up PAM® survey collected on at least 25% of all eligible patients within 4 to 12 months of the baseline during the performance period.</p> <p>Updated denominator exception: Revised: For Submission Criteria 1: to remove patients with excessive missing responses or patients who were not seen for the second PAM survey within 4 months of the baseline.</p> <p>Updated denominator exclusion: Added: For ALL Submission Criteria: Patients who died during the performance period.</p> <p>Updated numerator: Revised: for ALL Submission Criteria: timing of follow-up PAM® survey to occur 4 to 12 months after baseline.</p> <p>Updated numerator definition: Added: For Submission Criteria 1: clarification as to what denotes excessive missing responses for each PAM survey.</p>
Measure Steward:	Insignia Health, LLC, a wholly owned subsidiary of Phreesia
High Priority Measure:	Yes
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale	<p>We proposed to revise multiple components of this measure to allow re-administration of the PAM® survey no less than 4 months after the baseline survey is administered as opposed to 6 months. This change will allow a higher percentage of patients to complete the survey and be included in the measure denominator.</p> <p>In addition, we proposed to lower the minimum performance threshold for collected follow-up PAM® surveys from 50 percent to 25 percent and remove patients who were missing more than 3 responses on the PAM-10® surveys or more than 4 responses on the PAM-13® surveys. Revising the threshold for the collected follow-up PAM® survey reduces clinician burden by lowering the number of survey responses that need to be collected to meet the measure denominator. We also proposed to add a definition to clarify what denotes excessive for missing responses. Removing patients with excessive missing responses allows for a more complete assessment of an individual's knowledge, skills, and confidence for managing their health and health care.</p> <p>In addition, we proposed to increase the number of qualifying visits to two during the performance period and add an exclusion to remove patients who may have died during the performance period. These revisions to the denominator ensure a patient is established within that clinician's patient population which supports the completion of the baseline and follow-up of the survey.</p>

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed substantive changes to measure Q503: Gains in Patient Activation Measure (PAM®) Scores at 12 Months. One of these commenters agreed with the proposal to lower the minimum performance threshold for collected follow-up PAM® surveys from 50 percent to 25 percent and supported the proposed modification to the denominator criteria to require two visits. This will ensure patients who are lost to follow-up do not count against a reporting clinician.

Response: We thank the commenters for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62567), we are finalizing the changes to measure Q503 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

D.64. Initiation, Review, and/or Update to Suicide Safety Plan for Individuals with Suicidal Thoughts, Behavior, or Suicide Risk

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	504
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM Specifications
Current Measure Description:	Percentage of adult aged 18 years and older with suicidal ideation or behavior symptoms (based on results of a standardized assessment tool or screening tool) or increased suicide risk (based on the clinician's evaluation or clinician-rating tool) for whom a suicide safety plan is initiated, reviewed, and/or updated in collaboration between the patient and their clinician.
Substantive Change:	<p>The measure description is revised to read: Percentage of patients aged 12 years and older with suicidal ideation or behavior symptoms (based on results of a standardized assessment tool or screening tool) or increased suicide risk (based on the clinician's evaluation or clinician-rating tool) for whom a suicide safety plan is initiated, reviewed, and/or updated in collaboration between the patient and their clinician.</p> <p>The measure denominator is revised to read: For denominator submission criteria 1 & 2: Patients aged 12 years and older with a mental and/or substance use disorder with suicidal ideation and/or behavior symptoms or suicide risk at a clinical encounter during the denominator identification period.</p>
Measure Steward:	American Psychiatric Association
High Priority Measure:	Yes
Measure Type:	Process
Rationale	We proposed to revise the age from 18 years and older to 12 years and older for denominator eligibility as suicide risk assessment is an important part of child and adolescent mental health, as noted in an American Academy of Pediatrics publication. ¹¹⁴¹ "Suicide is the second leading cause of death for 10- to 24-year-olds in the United States and is a global public health issue, with a recent declaration of a National State of Emergency in Children's Mental Health by the American Academy of Pediatrics, American Academy of Child and Adolescent Psychiatry, and Children's Hospital Association." ¹¹⁴²

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to measure Q504: Initiation, Review, and/or Update to Suicide Safety Plan for Individuals with Suicidal Thoughts, Behavior, or Suicide Risk to include patients 12 years and older as part of data collection. However, the commenter recommended lowering the age to 10 years and older to capture the quality of care for a broader population of patients who are impacted by suicide.

Response: We thank the commenter for supporting the substantive changes to this measure and appreciate the feedback regarding lowering the age to 10. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62568), we are finalizing the changes to measure Q504 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

¹¹⁴¹ Hua, L. L., Lee, J., Rahmandar, M. H., Sigel, E. J., Committee on Adolescence, & Council on Injury, Violence, and Poison Prevention. (2024). Suicide and Suicide Risk in Adolescents. *Pediatrics*, 153(1), e2023064800. <https://doi.org/10.1542/peds.2023-064800>.

¹¹⁴² See footnote Hua et al., 2024.

Table Group DD: Finalized Substantive Changes to Previously Finalized MIPS Quality Measures Available Only for Use in Relevant MVPs for the CY 2025 Performance Period/2027 MIPS Payment Year and Future Years

As finalized for the CY 2024 performance period/2026 MIPS payment year and future years, the following three MIPS quality measures were retained for utilization in MVPs only while removed from traditional MIPS: Q112: Breast Cancer Screening, Q113: Colorectal Cancer Screening, and Q128: Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan (88 FR 79897 through 79902). We note that some MIPS quality measures available only in MVPs are adopted by the Medicare Shared Savings Program for utilization in the Alternative Payment Model (APM) Performance Pathway (APP) and/or APP Plus, as finalized in section IV.A.4.c.(3) of this final rule. For such measures, the collection type applicable for purposes of the APP and/or APP Plus (Medicare CQM for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare CQM)) is also specified as a collection type available for such measures described in Table Group DD.

Table Group DD within this final rule provides substantive changes finalized for the CY 2025 performance period/2027 MIPS payment year for MIPS quality measures available only in a relevant MVP. Two of the aforementioned MIPS quality measures, Q112 and Q113, have substantive changes under Table Group DD. The changes that are made to the denominator codes sets are generalizations of the revisions communicated from the measure stewards to CMS. Additionally, International Classification of Diseases Tenth Edition (ICD-10) and Current Procedural Terminology (CPT) codes that are identified as invalid for CY 2025 may not be identified within this final rule due to the availability of these changes to the public. If coding revisions to the denominator are impacted due to the timing of 2025 CPT and ICD-10 updates and assessment of these codes' inclusion by the Measure Steward, these changes may be postponed until CY 2026. The 2025 Quality Measure Release Notes provide a comprehensive, detailed reference of exact codes changes to the denominators of the quality measures. The Quality Measure Release Notes are available for each of the collection types in the Quality Payment Program website at <https://qpp.cms.gov>.

Note: Electronic clinical quality measures (eCQMs) that are endorsed by a CBE are shown in Table DD of this Appendix as follows: CBE # / eCQM CBE #.

In addition to the finalized substantive changes, there may be changes to the coding utilized within the denominator that are not considered substantive in nature, but they are important to communicate to interested parties. These changes align with the scope of the current coding; however, though not substantive in nature, these changes will expand or contract the measure's current eligible patient population. Therefore, please refer to the current year measure specification and the 2025 Quality Measure Release Notes or the eCQM Technical Release Notes once posted to review all coding changes to ensure correct implementation.

The eCQM Technical Release Notes should also be carefully reviewed for revisions within the logic portion of the measure. In addition to the proposed substantive changes, there may be revisions within the logic that are not considered substantive in nature; however, it is important to review to ensure proper implementation of the measure. As not all systems and clinical workflows are the same, it is important to review these changes in the context of a specific system and/or clinical workflow.

We solicited comments on these substantive changes.

DD.1. Breast Cancer Screening

Category	Description
CBE # / eCQM CBE #:	2372 / N/A
Quality #:	112
CMS eCQM ID:	CMS125v13
Current Collection Type:	Medicare Part B Claims Measure Specifications / eCQM Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of women 40 - 74 years of age who had a mammogram to screen for breast cancer in the 27 months prior to the end of the measurement period.
Substantive Change:	<p>Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQM Specifications, and Medicare CQM Specifications (collection type available only in the APP and/or APP Plus).</p> <p>Updated denominator exclusion: For all collection types: Removed: specific encounter requirements from the frailty/advanced illness exclusion.</p>
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the denominator exclusion by removing the requirement for patients to have had at least one inpatient or two outpatient encounters to recognize a diagnosis of advanced illness. The removal of this requirement within the denominator exclusion reduces the burden of identifying applicable encounters, while still identifying patients with an indication of frailty. This is particularly applicable for those patients seen outside of their reporting clinician's medical record. This revision will update the denominator exclusion to remove any patient 66 years of age and older who has a diagnosis of advanced illness during the measurement period or the year prior from the denominator of measure Q112. Decreasing complexity and burden of this element ensures consistent implementation allowing for more comparable data.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to the frailty exclusion criteria to measure Q112: Breast Cancer Screening. The removal of the encounter criteria will reduce reporting burden while still following through with the intent of the exclusion for patients with an indication of frailty.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62570), we are finalizing the changes to measure Q112 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

DD.2. Colorectal Cancer Screening

Category	Description
CBE # / eCQM CBE #:	0034 / N/A
Quality #:	113
CMS eCQM ID:	CMS130v13
Current Collection Type:	Medicare Part B Claims Measure Specifications / eCQM Specifications / MIPS CQM Specifications
Current Measure Description:	Percentage of patients 45-75 years of age who had appropriate screening for colorectal cancer.
Substantive Change:	<p>Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQM Specifications, and Medicare CQM Specifications (collection type available only in the APP and/or APP Plus)</p> <p>Updated denominator exclusion: For all collection types: Removed: specific encounter requirements from the frailty/advanced illness exclusion.</p>
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale	We proposed to update the denominator exclusion by removing the requirement for patients to have had at least one inpatient or two outpatient encounters to recognize a diagnosis of advanced illness. The removal of this requirement within the denominator exclusion reduces the burden of identifying applicable encounters, while still identifying patients with an indication of frailty. This is particularly applicable for those patients seen outside of their reporting clinician's medical record. This revision will update the denominator exclusion to remove any patient 66 years of age and older who has a diagnosis of advanced illness during the measurement period or the year prior from the denominator of measure Q113. Decreasing complexity and burden of this element ensures consistent implementation allowing for more comparable data.

We received public comments on the substantive changes proposed for this measure. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposed substantive changes to the frailty exclusion criteria to measure Q113: Colorectal Cancer Screening. The removal of the encounter criteria will reduce reporting burden while still following through with the intent of the exclusion for patients with an indication of frailty.

Response: We thank the commenter for supporting the substantive changes to this measure.

After consideration of public comments, and for the reasons stated above and in the proposed rule (89 FR 62570), we are finalizing the changes to measure Q113 as proposed for the CY 2025 performance period/2027 MIPS payment year and future years.

APPENDIX 2: IMPROVEMENT ACTIVITIES

We refer readers to the CY 2025 Physician Fee Schedule (PFS) proposed rule (89 FR 62056 through 62057 and 89 FR 62571 through 62581), where we proposed for the CY 2025 performance period/2027 MIPS payment year and future years to add two new improvement activities, modify two previously adopted improvement activities, and remove eight previously adopted improvement activities. We refer readers to 89 FR 62056 of the CY 2025 PFS proposed rule for additional details on the Call for Improvement Activities process. In this final rule, for the CY 2025 performance period/2027 MIPS payment year and future years, we are adding **two** new improvement activities, modifying **one** previously adopted improvement activity, and removing **four** previously adopted improvement activities. These changes are discussed in section IV.A.4.e.(3)(b)(iii) of this final rule and in more detail below.

**TABLE A: New Improvement Activities
for the CY 2025 Performance Period/2027 MIPS Payment Year and for Future Years**

New Improvement Activity	
Proposed Activity ID:	IA_PM_24
Proposed Subcategory:	Population Management
Proposed Activity Title:	Implementation of Protocols and Provision of Resources to Increase Lung Cancer Screening Uptake
Proposed Activity Description:	<p>Establish a process or procedure to increase rates of lung cancer screening through one or more of the following interventions:</p> <ul style="list-style-type: none"> • Implementation of protocols that support enhanced documentation methods to identify eligible patients for lung cancer screening. <ul style="list-style-type: none"> ++ Example: A practice could embed electronic health record (EHR) prompts to flag insufficient patient smoking history (for example, total pack-years) and increase practice awareness around patient eligibility for screening ++ Example: A practice could implement documentation processes or procedures (for example, retrospective chart review, lung cancer screening eligibility questionnaire) to improve patient lung cancer screening eligibility data in the medical record • Development of a patient outreach and activation plan consisting of educational materials and resources for patients at high-risk of lung cancer for improved patient engagement and decision-making. <ul style="list-style-type: none"> ++ Example: Providers or clinic staff could provide culturally and linguistically appropriate patient-directed educational or care navigation materials related to lung cancer screening, eligibility criteria for low-dose computed tomography (LDCT), and the purpose and benefits of screening ++ Example: Providers or clinic staff could provide tools to prepare patients for shared decision-making (SDM) clinical encounters and promote patient/provider communication on lung cancer screening decision-making • Establishment of a navigation program to improve uptake and adherence of lung cancer screening and increase rates of LDCT referral completion. <ul style="list-style-type: none"> ++ Example: A practice could designate and train existing clinic staff or hire an additional staff member to counsel patients on the importance of lung cancer screening and refer them to existing resources (for example, transportation assistance, translator, financial services, appointment scheduling) to support ability to obtain LDCT ++ Example: A practice could create a process to follow up with referred patients via telephone reminders or virtual notifications (for example, email, patient charts)
Rationale:	Lung cancer is a leading cause of cancer-related deaths (21%) in the U.S., more than colon and breast cancers combined. ^{1,2} While there are established guidelines for the targeted use of LDCT for eligible patients, including particular criteria for age and

smoking history^{3,4}, national lung cancer screening (LCS) rates are estimated at only 6.5% as of 2020, compared to 63% for colon and 64% for breast cancer screening in 2019.^{5,6}

Evidence demonstrates that screening for lung cancer can improve patient outcomes. The implementation of protocols that support enhanced documentation methods to identify eligible patients for LCS has been found to increase early-stage lung cancer detection, in one study by 24 percent (Russel et al., 2022).⁷ Other studies have also shown benefits from enhancing documentation to allow for more appropriate LCS:

- Following a retrospective chart review of existing patient smoking history and implementation of a notification system for primary care providers (PCPs), a community hospital identified 82 percent of patients who were eligible for LCS not yet referred for screening, and of that, 31 percent completed an LDCT referral.⁸
- Implementation of a clinical reminder system in an EHR to refer eligible patients to an LCS program, increased the number of LDCTs performed from 54 percent to 79 percent in one Veterans Affairs (VA) medical center.⁹
- EHR prompts generating a notification for providers to order LDCT screening for eligible patients, increased documentation of complete patient smoking history by 31 percent.¹⁰
- Updating patient pack-year data in the EHR through a patient questionnaire on smoking history and implementation of an EHR screen assessing pack-year data in alignment with evidence-based guidelines; development of a patient outreach and activation plan consisting of educational materials and resources for patients at high-risk of lung cancer for improved patient engagement and decision-making; among patients from a tobacco quit-line utilizing a video-based LCS decision aid, 50 percent reported feeling well-prepared to make screening decisions than with traditional materials and 68 percent reported being clear about their values related to the harms and benefits of screening. Additionally, patients using the decision-aid were more knowledgeable about LCS than participants using standard educational materials at each follow-up assessment.¹¹
- A web-based tool developed for SDM led to improved patient engagement, knowledge of LDCT, and preparation for SDM discussions among veterans in a primary care setting.¹²
- A computer tailored decision-support tool developed in alignment with the U.S. Preventive Services Task Force (USPSTF) LCS guidelines, increased LCS knowledge scores (2.33 mean change) and patient-perceived self-efficacy and benefits of LCS in a community-based clinic.¹³

Evidence also demonstrates the outcomes-improvement potential of the establishment of a navigation program to improve uptake and adherence of LCS and to increase rates of LDCT referral completion:

- In a patient navigator-led program including patient outreach to determine LCS eligibility, SDM discussions, and appointment-scheduling with patient's PCPs, 23.5 percent of LDCTs were performed in the intervention group compared to 8.6 percent in the control group among high-risk current smokers across 5 community health centers.¹⁴
- An oncology nurse navigator-led provider education program resulted in improved provider knowledge of LDCT and documented tobacco cessation discussions, as well as increased LDCT ordering for eligible patients.¹⁵
- A nurse-practitioner-led LCS clinic observed a 60 percent increase in the total number of LDCTs conducted and 85 percent of stakeholder participants noted the clinic was effective at addressing barriers to LCS.¹⁶

Exemplifying the importance of efforts seeking to increase LCS and follow up, guidelines and recommendations on expanded LCS eligibility criteria and SDM requirements by the Centers for Medicare & Medicaid Services (CMS) have recently been implemented:

- In 2021, leading LCS clinical guideline developers, including USPSTF and the AAFP lowered the starting age of LCS with LDCT from 55 to 50 years and

	<p>patient pack-year history from 30 to 20 years, resulting in a larger eligible screening population.^{17,3}</p> <ul style="list-style-type: none"> • In 2022, under the Medicare National Coverage Determination, CMS expanded LCS eligibility criteria for age and pack-year history for beneficiaries receiving LDCT in alignment with clinical guidelines (for example, USPSTF, AAFP). • In addition to the expanded eligibility criteria, CMS requires a counseling and SDM visit to be appropriately documented in a patient’s medical record and be inclusive of determination of beneficiary eligibility and the use of one or more decision-aids.¹⁸ <p>There is also published evidence that cost-effectiveness of care can improve as a result of expanded eligibility screening. Research has found downstream effects linked to early detection and prevention in LCS to be associated with long-term cost-effectiveness in LCS care delivery:</p> <ul style="list-style-type: none"> • In 2021, the USPSTF expanded screening recommendations to include individuals at an earlier age of 50 from 55 years, and minimum cumulative smoking exposure from 30 to 20 pack-years. An economic evaluation of this guideline change indicated that the updated recommendations were cost effective compared to the earlier recommendations, with a mean incremental cost-effectiveness ratio of \$72,564 per quality-adjusted life-year (QALY) gained.¹⁹ • One study demonstrates the cost-savings of earlier diagnosis of lung cancer. In a review of patients with non-small cell lung cancer (NSCLC), it was revealed that the total per-patient per-month health care costs after diagnosis were significantly higher among those diagnosed at a Stage IV and lower among those diagnosed at Stage I (\$7,239 Stage I, \$9,484 Stage II, \$11,193 Stage IIIa, \$17,415 Stage IIIb, and \$21,441 Stage IV).²⁰ • One modeling study of costs and outcomes associated with lung cancer found that implementation of a patient navigation program is cost-effective for lung cancer patients in Medicare, including that the program was cost-effective at a probability of 0.91 at \$100,000/QALY.²¹ • Given the significant impact of lung cancer in the U.S.--and the effectiveness of LCS and related interventions--as noted above, this activity has a high likelihood of making a positive impact on outcomes for eligible clinicians’ patients.
<p>Comment & Response:</p>	<p><i>Comment:</i> We received comments in support of this new activity, citing that this will promote increased utilization of these important screenings.</p> <p><i>Response:</i> We appreciate the supportive comments regarding this new activity.</p>
<p>Final Action:</p>	<p>We are finalizing this new activity as proposed.</p>
<p>New Improvement Activity</p>	
<p>Proposed Activity ID:</p>	<p>IA_PM_25</p>
<p>Proposed Subcategory:</p>	<p>Population Management</p>
<p>Proposed Activity Title:</p>	<p>Save a Million Hearts: Standardization of Approach to Screening and Treatment for Cardiovascular Disease Risk</p>
<p>Proposed Activity Description:</p>	<p>Implement standardized, evidence-based cardiovascular disease risk assessment and care management for a defined population in the clinician’s practice.</p> <p>The clinician or clinician group will apply standardized risk assessment and care management to a broad, clinician-defined patient population in the practice. The population can be defined by 1) patient age and/or atherosclerotic cardiovascular disease (ASCVD) risk factors; or 2) the constraints of the risk assessment tool (for example, the American College of Cardiology (ACC)/American Heart Association (AHA) ASCVD Risk Calculator is validated for patients over age 40).</p> <p>The results of screening and the plan for treatment and follow up will be documented using a standardized method in the patient’s medical record. Care management plan and follow up intervals will be influenced by the degree of patient risk.</p>

	Cardiovascular care management should be defined by risk assessment and lead to the development of individualized care plans with specific goals. Shared decision making should be part of the development of every patient care plan.
Rationale:	<p>Heart disease is the leading cause of death in the United States. Stroke is the fifth most common cause of death in the United States.²²This activity is informed by the results of the CMS Innovation Center Million Hearts Model, which included initial ASCVD assessment as well as cardiovascular care management.²³ The Million Hearts Model used the ACC/AHA ASCVD Risk Calculator: ASCVD Risk Estimator (acc.org).²⁴</p> <p>The proposed new activity supports improved identification and treatment of patients at risk for ASCVD, and would expand on the work of the model in two ways: (1) increasing flexibility in requirements, allowing more clinician specialties to participate, along with increased flexibility in risk assessment to fit the needs of attesting clinicians and their patient populations; (2) requiring the use of structured documentation of risk factors and associated treatment plans with the aim of addressing all risk factors directly.</p> <p>This activity accommodates the use of any evidence-based approach to risk evaluation and patient care management that is implemented using standardized methods and across an entire patient population. The ASCVD Risk Estimator used by the Million Hearts Model is evidence based and simple to implement but may not be appropriate for every practice scenario or patient population. There is strong published evidence validating the ACC/AHA ASCVD Risk Calculator; describing optimal care for coronary artery disease (including making comparisons to European Union best practices); and providing guidelines for primary prevention of coronary artery disease.^{25,26,27,28}</p>
Comment & Response:	<p><i>Comment:</i> We received comments in support of this new activity, citing that this will promote increased utilization of these important screenings.</p> <p><i>Response:</i> We appreciate the supportive comments regarding this new activity.</p>
Final Action:	We are finalizing this new activity as proposed.

TABLE B: Changes to Previously Adopted Improvement Activities for the CY 2025 Performance Period/2027 MIPS Payment Year and for Future Years

In this final rule, we are modifying **one** previously finalized improvement activity for the CY 2025 performance period/2027 MIPS payment year and future years. This change is discussed in section IV.A.4.e.(3)(b)(iii) of this final rule and in more detail below.

Current Improvement Activity	
Current Activity ID:	IA ERP 6
Current Subcategory:	Emergency Response & Preparedness
Current Activity Title:	COVID-19 Vaccine Achievement for Practice Staff
Current Activity Description:	Demonstrate that the MIPS eligible clinician's practice has maintained or achieved a rate of 100 percent of office staff staying up to date with COVID vaccines according to the Centers for Disease Control and Prevention. ²⁹ Please note that those who are determined to have a medical contraindication specified by CDC recommendations are excluded from this activity.
Current Weighting:	Medium
Proposed Activity ID:	IA_PM_26
Proposed Subcategory:	Population Management
Proposed Revised Activity Title:	Vaccine Achievement for Practice Staff: COVID-19, Influenza, and Hepatitis B
Proposed Revised Activity Description:	Demonstrate that the MIPS eligible clinician's practice has achieved and/or maintained a vaccination rate of 60 percent of clinical practice staff for COVID-19, and 80 percent for influenza. Demonstrate vaccination, immunity, or non-responder status to hepatitis B for 95 percent of clinical practice staff. Vaccination recommendations are from Centers for Disease Control and Prevention; staff with contraindications to the vaccinations, as determined by the CDC, are excluded from the requirements. Vaccines and Immunizations CDC.
Proposed Change and Rationale:	Adjusting the target goals for this activity would align with the latest CDC recommendations and feedback received indicates that the proposal could increase the activity's utilization. Additionally, we are expanding the focus of this activity to include influenza and hepatitis B to highlight the importance of staff vaccination for vaccine-preventable diseases prevalent today. We also proposed a change in this activity's subcategory, from Emergency Response & Preparedness to Population Management, to emphasize that staff vaccination is a long-term strategy in reducing morbidity and mortality rates for these diseases.
Comment & Response:	<p><i>Comment:</i> We received comments in general support of this activity modification. One commenter pointed out that this revised activity will promote workforce safety from serious illness, enabling clinicians to continue providing essential long-term patient care, as well as limiting the potential spread of diseases to vulnerable patients.</p> <p><i>Response:</i> We appreciate the supportive comments regarding this activity modification, and we will continue with our approach of reviewing, assessing, and refining each activity on a regular basis for relevance and effectiveness in promoting clinical practice improvement.</p>
Final Action:	We are finalizing this activity modification as proposed.
Current Improvement Activity	
Current Activity ID:	IA_BE 4
Current Subcategory:	Beneficiary Engagement
Current Activity Title:	Engagement of patients through implementation of improvements in patient portal
Current Activity Description:	To receive credit for this activity, MIPS eligible clinicians must provide access to an enhanced patient/caregiver portal that allows users (patients or caregivers and their clinicians) to engage in bidirectional information exchange. The primary use of this portal should be clinical and not administrative. Examples of the use of such a portal

	include but are not limited to: brief patient reevaluation by messaging; communication about test results and follow up; communication about medication adherence, side effects, and refills; blood pressure management for a patient with hypertension; blood sugar management for a patient with diabetes; or any relevant acute or chronic disease management.
Current Weighting:	Medium
Proposed Activity ID:	IA_BE_4
Proposed Subcategory:	Beneficiary Engagement
Proposed Revised Activity Title:	Engagement of Patients through Implementation of New Patient Portal
Proposed Revised Activity Description:	To receive credit for this activity, MIPS eligible clinicians must implement and provide access to a new patient/caregiver portal that allows users (patients or caregivers and their clinicians) to engage in bidirectional information exchange. The primary use of this portal should be clinical and not administrative. Examples of the use of such a portal include, but are not limited to, the following: brief patient reevaluation by messaging; communication about test results and follow up; communication about medication adherence, side effects, and refills; blood pressure management for a patient with hypertension; blood sugar management for a patient with diabetes; and/or any relevant acute or chronic disease management.
Proposed Change and Rationale:	We proposed to modify this activity's description and its validation criteria to specify the implementation of a new patient/caregiver portal by clinicians who were not previously using a patient portal. This activity was originally created during a time of transition to EHRs to encourage electronic information exchange. It has become standard practice to use patient portals; therefore, the activity is likely no longer driving improvement among clinicians who have already implemented a patient portal. This activity has been highly utilized year over year and continues to be in the top ten activities reported. Limiting the activity to clinicians that implement new patient portals in practices that previously did not use them would refocus the measure on its original purpose and encourage clinicians who have previously implemented patient portals to report other improvement activities that may offer meaningful opportunities for improvement.
Comment & Response:	<p><i>Comment:</i> Several commenters supported our Inventory changes as proposed.</p> <p><i>Response:</i> We appreciate commenters' support as well as suggestions on ways to maintain an Inventory of activities that are diverse, robust, and meaningful.</p> <p><i>Comment:</i> Multiple commenters did not support this modification to limit this activity to new patient portal users. A few commenters argued that maintaining an established patient portal and deploying new functionalities demonstrates a continued commitment to quality improvement and a significant financial investment, and that current clinicians who regularly use a patient portal should also be able to attest to this improvement activity.</p> <p><i>Response:</i> We disagree with the commenters that stated the activity should remain available for the maintenance of a patient portal. The implementation of a patient portal is a specific action that promotes clinical improvement. While maintaining and updating an existing patient portal is an integral part of supporting patient engagement and health information exchange, it does not improve clinical care relative to the prior year.</p> <p><i>Comment:</i> Several commenters requested that CMS give a one-year notice before modifying this activity so that practices have enough time to plan for changes.</p>

	<i>Response:</i> In response to comments received requesting a one-year notice before modifying this activity, we are delaying implementation of this activity modification to give clinicians additional time to prepare to report alternate activities.
Final Action:	We are delaying implementation of this activity modification. It will be effective beginning with the CY 2026 performance period/2028 MIPS payment year.

²⁹Centers for Disease Control and Prevention (2024). Stay Up to Date with COVID-19 Vaccines. Last Updated April 25, 2024. <https://www.cdc.gov/coronavirus/2019-ncov/vaccines/stay-up-to-date.html>

**TABLE C: Improvement Activities Being Removed
for the CY 2025 Performance Period/2027 MIPS Payment Year and for Future Years**

In this final rule, we are removing **four** previously finalized improvement activities beginning with the CY 2025 performance period/2027 MIPS payment year. These changes are discussed in section IV.A.4.e.(3)(b)(iii) of this final rule and in more detail below; activity removal factors are discussed in the CY 2020 PFS final rule (84 FR 62568 through 63563).

Current Improvement Activity	
Current Activity ID:	IA EPA 1
Current Subcategory:	Expanded Practice Access
Current Activity Title:	Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record
Current Activity Description:	<p>Provide 24/7 access to MIPS eligible clinicians, groups, or care teams for advice about urgent care (for example, MIPS eligible clinician and care team access to medical record, cross-coverage with access to medical record, or protocol-driven nurse line with access to medical record) that could include one or more of the following:</p> <ul style="list-style-type: none"> • Expanded hours in evenings and weekends with access to the patient medical record for example, coordinate with small practices to provide alternate hour office visits and urgent care); • Use of alternatives to increase access to care team by MIPS eligible clinicians and groups, such as e-visits, phone visits, group visits, home visits and alternate locations (for example, senior centers and assisted living centers); and/or • Provision of same-day or next-day access to a MIPS eligible clinician, group or care team when needed for urgent care or transition management.
Current Weighting:	High
Removal Rationale:	<p>We proposed to remove this activity under removal factor seven, activity is obsolete; this activity was created, in part, to incentivize utilization of EHRs to increase access to clinicians in off hours and decrease emergency room (ER) visits. Today, EHRs are highly utilized, and this activity has become standard of care. This is supported by the fact that this activity continues to be in the top ten activities reported, indicating that it is overutilized and that the clinical practice improvement promoted by the activity has been achieved. We proposed the removal of this activity in the context of our regular review of the Inventory. In conducting this review recently, we concluded that the goal of this activity has been widely achieved by eligible clinicians and practices.</p>
Comment & Response:	<p><i>Comment:</i> We received comments expressing broad support for this activity removal.</p> <p><i>Response:</i> We appreciate the supportive comments.</p> <p><i>Comment:</i> Several commenters expressed concern about removing this activity, citing the importance of clinicians' having continual access to their patient medical records. One commenter suggested that, rather than removing the activity, it should be limited to newly established access to patient medical records. A few commenters requested that CMS give a one-year notice before removing or modifying an activity so that practices have enough time to plan for changes.</p> <p><i>Response:</i> We also acknowledge commenters' expressions of concern about this removal. The establishment of expanded hours of access to patient medical records, alternative methods for accessing patient information, and/or a process for providing rapid access to patient information during urgent care or transition management are specific actions that promote clinical improvement. While maintaining 24/7 access to patient records for clinicians is an integral part of health information exchange, maintaining this access does not improve care relative to the prior year. More broadly, this improvement activity is obsolete because there has been widespread adoption of EHR systems that provide 24/7 access to and health exchange of patient data for clinicians and groups.</p>

Final Action:	We are finalizing this activity removal as proposed.
Current Improvement Activity	
Current Activity ID:	IA_PM_12
Current Subcategory:	Population Management
Current Activity Title:	Population empanelment
Current Activity Description:	<p>Empanel (assign responsibility for) the total population, linking each patient to a MIPS eligible clinician or group or care team.</p> <p>Empanelment is a series of processes that assign each active patient to a MIPS eligible clinician or group and/or care team, confirm assignment with patients and clinicians, and use the resultant patient panels as a foundation for individual patient and population health management.</p> <p>Empanelment identifies the patients and population for whom the MIPS eligible clinician or group and/or care team is responsible and is the foundation for the relationship continuity between patient and MIPS eligible clinician or group /care team that is at the heart of comprehensive primary care. Effective empanelment requires identification of the “active population” of the practice: those patients who identify and use your practice as a source for primary care. There are many ways to define “active patients” operationally, but generally, the definition of “active patients” includes patients who have sought care within the last 24 to 36 months, allowing inclusion of younger patients who have minimal acute or preventive health care.</p>
Current Weighting:	Medium
Removal Rationale:	We proposed to remove this activity under removal factor seven, activity is obsolete; this activity was designed in the early years of the MIPS program to highlight the importance of patient population empanelment to drive patient-centered care and, over time, to drive quality improvement. Empanelment is now more widely accepted and/or used as an option to drive and/or measure comprehensive care, and this activity has no requirement for implementation or improvement beyond the empanelment; therefore, we are recommending its removal.
Comment & Response:	<p><i>Comment:</i> Several commenters supported our Inventory changes as proposed. A few commenters did not support this removal, arguing that panel management is a critical, ongoing activity that requires regular monitoring to adjust for patient acuity and clinician workloads. One commenter suggested that, rather than removing the activity, it should be limited to new reporters for a finite number of years.</p> <p><i>Response:</i> We appreciate commenters’ suggestions. This improvement activity is obsolete because the establishment of empanelment processes has been widely achieved and annual maintenance, while integral, does significantly improve clinical care relative to the prior year.</p> <p><i>Comment:</i> A few commenters requested that CMS give a one-year notice before removing or modifying an activity so that practices have enough time to plan for changes.</p> <p><i>Response:</i> In response to comments received requesting a one-year notice before removing this activity, we are delaying implementation of this activity removal to give clinicians additional time to prepare to report alternate activities.</p>
Final Action:	We are delaying implementation of this activity removal. It will be effective beginning with the CY 2026 performance period/2028 MIPS payment year.
Current Improvement Activity	
Current Activity ID:	IA_CC_1
Current Subcategory:	Care Coordination
Current Activity Title:	Implementation of use of specialist reports back to referring clinician or group to close referral loop
Current Activity Description:	Performance of regular practices that include providing specialist reports back to the referring individual MIPS eligible clinician or group to close the referral loop or where the referring individual MIPS eligible clinician or group initiates regular inquiries to

	specialist for specialist reports which could be documented or noted in the EHR technology.
Current Weighting:	Medium
Removal Rationale:	We proposed to remove this activity under removal factor one, this activity is duplicative, and factor five, this activity does not align with the quality, cost, or Promoting Interoperability performance categories. This activity provides credit for ensuring that consultation reports are communicated between an ordering and a consulting provider, and this is now standard of care. Also, this concept is redundant with some quality and Quality Clinical Data Registry (QCDR) measures, including QM#374. Our recommendation for removal is supported by the fact that this activity continues to be in the top ten activities reported, indicating that it is overutilized and that the clinical practice improvement promoted by the activity has been achieved. We proposed the removal of this activity in the context of our regular review of the Inventory. In conducting this review recently, we concluded that the goal of this activity has been widely achieved by eligible clinicians and practices.
Comment & Response:	<p><i>Comment:</i> Several commenters supported our Inventory changes as proposed. A few commenters did not support this removal because supporting electronic referral loops contributes to delivering well-coordinated, patient-centered care.</p> <p><i>Response:</i> We appreciate commenters' feedback. The practice of closing the referral loop among specialists and referring clinicians has been widely achieved and credit for completing this action is already being offered in other performance categories, making this activity duplicative of and out of alignment with the quality measures performance category.</p> <p><i>Comment:</i> Several commenters requested that CMS give a one-year notice before removing this activity so that practices have enough time to plan for changes.</p> <p><i>Response:</i> In response to comments received requesting a one-year notice before removing this activity, we are delaying implementation of this activity removal to give clinicians additional time to prepare to report alternate activities.</p>
Final Action:	We are delaying implementation of this activity removal. It will be effective beginning with the CY 2026 performance Period/2028 MIPS payment year.
Current Improvement Activity	
Current Activity ID:	IA_CC_2
Current Subcategory:	Care Coordination
Current Activity Title:	Implementation of improvements that contribute to more timely communication of test results
Current Activity Description:	Timely communication of test results defined as timely identification of abnormal test results with timely follow-up.
Current Weighting:	Medium
Removal Rationale:	We proposed to remove this activity under removal factor seven, activity is obsolete. This activity was created, in part, to encourage strategies for timely communication and to improve upon those strategies. This process has become widely used with the use of EHRs and the adoption of patient portals and is now standard of care. This is supported by the fact that this activity continues to be in the top ten activities reported, indicating that it is overutilized. We proposed the removal of this activity in the context of our regular review of the Inventory. In conducting this review recently, we concluded that the goal of this activity has been widely achieved by eligible clinicians and practices.
Comment & Response:	<p><i>Comment:</i> Several commenters supported our Inventory changes as proposed. A few commenters did not support this removal, arguing that timely communication of test results is an ongoing activity. One commenter suggested that, rather than removing the activity, it should be limited to new reporters for a finite number of years. A few commenters requested that CMS give a one-year notice before removing or modifying an activity so that practices have enough time to plan for changes.</p>

	<i>Response:</i> We appreciate commenters' suggestions. This improvement activity is obsolete because the establishment of processes to support timely communication of results has been widely achieved, and maintenance, while integral, does not significantly improve clinical care relative to the prior year. In response to comments received requesting a one-year notice before removing this activity, we are delaying implementation of this activity removal to give clinicians additional time to prepare to report alternate activities.
Final Action:	We are delaying implementation of this activity removal. It will be effective beginning with CY 2026 performance period/2028 MIPS payment ear.
Current Improvement Activity	
Current Activity ID:	IA ERP 4
Current Subcategory:	Emergency Response and Preparedness
Current Activity Title:	Implementation of a Personal Protective Equipment (PPE) Plan
Current Activity Description:	<p>Implement a plan to acquire, store, maintain, and replenish supplies of personal protective equipment (PPE) for all clinicians or other staff who are in physical proximity to patients.</p> <p>In accordance with guidance from the Centers for Disease Control and Prevention (CDC) the PPE plan should address:</p> <ul style="list-style-type: none"> • Conventional capacity: PPE controls that should be implemented in general infection prevention and control plans in healthcare settings, including training in proper PPE use. • Contingency capacity: actions that may be used temporarily during periods of expected PPE shortages. • Crisis capacity: strategies that may need to be considered during periods of known PPE shortages. <p>The PPE plan should address all of the following types of PPE:</p> <ul style="list-style-type: none"> • Standard precautions (for example, hand hygiene, prevention of needle-stick or sharps injuries, safe waste management, cleaning and disinfection of the environment) • Eye protection • Gowns (including coveralls or aprons) • Gloves • Facemasks • Respirators (including N95 respirators)
Current Weighting:	Medium
Removal Rationale:	We proposed to remove this activity under removal factor seven, activity is obsolete; since the COVID-19 pandemic, most clinicians are well prepared in PPE safety, as PPE enhancements have been made throughout patient care settings. It is unlikely that this activity will drive new improvements. We acknowledge the ongoing importance of PPE, and will work to ensure that, going forward, improvement activities that support continued enhancement and maintenance of PPE protocols are reflected in MIPS.
Comment & Response:	<p><i>Comment:</i> We received comments expressing general support for this activity removal. Two commenters expressed concern about the removal of this activity, citing that maintaining a plan for PPE will be essential for any future pandemics as well as everyday functioning of the health care system. A few commenters requested that CMS give a one-year notice before modifying or removing this activity so that practices have enough time to plan for changes.</p> <p><i>Response:</i> We appreciate commenters' suggestions. The implementation of PPE plans has been widely achieved. We will consider comments received urging CMS to develop and may propose through rulemaking an improvement activity that promotes a comprehensive approach to long-term sustenance of PPE protocols.</p>
Final Action:	We are finalizing this activity removal as proposed.
Current Improvement Activity	
Current Activity ID:	IA ERP 5
Current Subcategory:	Emergency Response and Preparedness
Current Activity Title:	Implementation of a Laboratory Preparedness Plan
Current Activity Description:	Develop, implement, update, and maintain a preparedness plan for a laboratory intended to support continued or expanded patient care during COVID-19 or another public

	<p>health emergency. The plan should address how the laboratory would maintain or expand patient access to health care services to improve beneficiary health outcomes and reduce healthcare disparities.</p> <p>For laboratories without a preparedness plan, MIPS eligible clinicians would meet with stakeholders, record minutes, and document a preparedness plan, as needed. The laboratory must then implement the steps identified in the plan and maintain them. For laboratories with existing preparedness plans, MIPS eligible clinicians should review, revise, or update the plan as necessary to meet the needs of the current PHE, implement new procedures, and maintain the plan.</p> <p>Maintenance of the plan in this activity could include additional hazard assessments, drills, training, and/or developing checklists to facilitate execution of the plan. Participation in debriefings to evaluate the effectiveness of plans are additional examples of engagement in this activity.</p>
Current Weighting:	Medium
Removal Rationale:	We proposed to remove this activity under removal factor seven, activity is obsolete; since the COVID-19 pandemic, most clinicians are now well prepared in COVID-19-related patient safety and laboratory-preparedness enhancements have been made throughout patient care settings. It is unlikely that this activity will drive new improvements. We acknowledge the ongoing importance of laboratory preparedness, and will work to ensure that, going forward, improvement activities that support continued enhancement and maintenance of lab preparedness protocols are reflected in MIPS.
Comment & Response:	<p><i>Comment:</i> We received comments expressing general support for this activity removal. Two commenters expressed concern about the removal of this activity, citing that maintaining a plan for laboratory preparedness will be essential for any future pandemics as well as everyday functioning of the health care system. A few commenters requested that CMS give a one-year notice before modifying or removing this activity so that practices have enough time to plan for changes.</p> <p><i>Response:</i> We appreciate commenters' suggestions. The implementation of laboratory preparedness plans has been widely achieved. We will consider comments received urging CMS to develop and may propose through rulemaking an improvement activity that promotes a comprehensive approach to long-term sustenance of lab preparedness protocols.</p>
Final Action:	We are finalizing this activity removal as proposed.
Current Improvement Activity	
Current Activity ID:	IA_BMH_8
Current Subcategory:	Behavioral and Mental Health
Current Activity Title:	Electronic Health Record Enhancements for BH data capture
Current Activity Description:	Enhancements to an electronic health record to capture additional data on behavioral health (BH) populations and use that data for additional decision-making purposes (for example, capture of additional BH data results in additional depression screening for at-risk patient not previously identified).
Current Weighting:	Medium
Removal Rationale:	We proposed to remove this activity under removal factor two, there is an alternative activity with a stronger relationship to quality care or improvements in clinical practice. This activity was created, in part, to assist in the transition from paper charts to EHRs. While the use of EHRs is now highly prevalent and has become part of current basic standards of care, there is still much progress to be made in terms of adoption and use of EHRs and other health information technologies in a behavioral health context. This activity, though, allows attestation with a low level of effort and with vague requirements related to clinical outcomes. Because there are other, more potentially impactful, behavioral health activities in the current Inventory, we are recommending that this activity be removed. IA_BMH_7, Implementation of Integrated Patient Centered Behavioral Health Model, which includes 'use of a registry or health information technology functionality to support active care management and outreach

	to patients in treatment,' is a strong alternative activity. We also intend, in future rulemaking, to develop a new activity (or to modify an existing activity) to promote the effective use of health information technologies in behavioral health.
Comment & Response:	<p><i>Comment:</i> Several commenters supported our Inventory changes as proposed. A few commenters did not support this removal, expressing concern that this sends a message that we are not prioritizing behavioral health.</p> <p><i>Response:</i> We appreciate commenters' feedback. We are committed to promoting the use of health information technology and exchange in behavioral health, as evidenced by our ongoing efforts to refocus the improvement activity Inventory on more high-impact improvement activities in general, including behavioral health improvement activities. Please see more discussion regarding this at section IV.A.4.e.(3)(b)(iii) of this final rule.</p> <p><i>Comment:</i> Multiple commenters requested that CMS give a one-year notice before removing or modifying an activity so that practices have enough time to plan for changes.</p> <p><i>Response:</i> In response to comments received requesting a one-year notice before removing this activity, we are delaying implementation of this activity removal to give clinicians additional time to prepare to report alternate activities.</p>
Final Action:	We are delaying implementation of this activity removal. It will be effective beginning with CY 2026 performance period/2028 MIPS payment ear
Current Improvement Activity	
Current Activity ID:	IA_PSPA_27
Current Subcategory:	Patient Safety and Practice Assessment
Current Activity Title:	Invasive Procedure or Surgery Anticoagulation Medication Management
Current Activity Description:	For an anticoagulated patient undergoing a planned invasive procedure for which interruption in anticoagulation is anticipated, including patients taking vitamin K antagonists (warfarin), target specific oral anticoagulants (such as apixaban, dabigatran, and rivaroxaban), and heparins/low molecular weight heparins, documentation, including through the use of electronic tools, that the plan for anticoagulation management in the periprocedural period was discussed with the patient and with the clinician responsible for managing the patient's anticoagulation. Elements of the plan should include the following: discontinuation, resumption, and, if applicable, bridging, laboratory monitoring, and management of concomitant antithrombotic medications (such as antiplatelets and nonsteroidal anti-inflammatory drugs (NSAIDs)). An invasive or surgical procedure is defined as a procedure in which skin or mucous membranes and connective tissue are incised, or an instrument is introduced through a natural body orifice.
Current Weighting:	Medium
Removal Rationale:	We proposed to remove this activity under removal factor one, this activity is duplicative. We recommend removal of this activity as its focus is duplicative with IA_CC_15: PSH [Perioperative-Surgical Home] Care Coordination. IA_CC_15 requires coordination of patient care through the perioperative period and includes anticoagulant management as one part of its requirements. This activity, IA_PSPA_27, is more tightly focused in an area that is high risk and, therefore, is not likely changing clinical practice widely. We acknowledge the ongoing importance of care coordination and medication management, and will work to ensure that, going forward, improvement activities that support continued enhancement and maintenance of anticoagulation medication management are reflected in MIPS.
Comment & Response:	<p><i>Comment:</i> We received comments expressing general support for this activity removal.</p> <p><i>Response:</i> We appreciate the supportive comments.</p>
Final Action:	We are finalizing this activity removal as proposed.

APPENDIX 3: MVP INVENTORY

MVP Development: Background

In the CY 2021 PFS final rule (85 FR 84849 through 84854), the CY 2022 PFS final rule (86 FR 65998 through 66031), and the CY 2023 PFS final rule (87 FR 70210 through 70211) we finalized a set of criteria to use in the development of MVPs, including MVP reporting requirements, MVP maintenance, and the selection of measures and activities within an MVP.

This appendix contains two groups of MVP tables: Group A, which includes six new MVPs and Group B, which includes modifications to 16 previously finalized MVPs. We received comments on all Group A and Group B MVPs with the comment summaries and responses following each MVP set of tables.

Each MVP includes measures and activities from the quality performance category, improvement activities performance category, and the cost performance category relevant to the clinical theme of the MVP. Each MVP also includes a foundational layer comprised of population health measures and Promoting Interoperability performance category measures.

MVP Development: Performance Category Sources

The MVP tables contain a set of MIPS quality measures, QCDR measures (as applicable), improvement activities, cost measures, and foundational measures based on clinical topics. For further reference, the sources of the measures and activities considered in developing the MVP tables are as follows:

- Existing MIPS quality measures are in the 2024 MIPS Quality Measures List on the Quality Payment Program website.¹¹⁴³ See Appendix 1: MIPS Quality Measures of this final rule for any additions (Table Group A), removals (Table Group C), or modifications to existing quality measures (Table Groups D and DD).

- Existing QCDR measures are based on the most recent publication of the 2024 QCDR Measure Specification file, located on the Quality Payment Program website.¹¹⁴⁴ We plan to modify the list of 2025 QCDR measures around December 2024.

- Improvement activities are in the 2024 Improvement Activities Inventory and the 2024 MIPS Data Validation Criteria, located on the Quality Payment Program website.¹¹⁴⁵ See Appendix 2: Improvement Activities of this final rule for any proposed additions (Table Group A), proposed modifications to existing improvement activities (Table Group B), or proposed removals (Table Group C).

- Existing cost measures are in the 2024 Cost Measures Inventory.¹¹⁴⁶ See section IV.A.4.e.(2) of this final rule for any additions or modifications to existing cost measures.

- For further details on the population health measures (attributed to the Quality Performance Category) included in the foundational layer, see the CY 2022 PFS final rule (86 FR 65408 through 65409).

- Existing Promoting Interoperability measures adopted in prior rulemaking and included in the foundational layer are located on the Quality Payment Program website.¹¹⁴⁷ We did not propose, and are not finalizing, any policy updates to the Promoting Interoperability performance category or any new, modified, or removed Promoting Interoperability measures for the CY 2025 performance period/2027 MIPS payment year (see section IV.A.4.e. of this final rule).

MVP Development: Improvement Activity Policy Update and Global Inclusion of an Improvement Activity

¹¹⁴³ See the 2024 MIPS Quality Measures List: <https://qpp-cm-prod-content.s3.amazonaws.com/uploads/2632/2024%20MIPS%20Quality%20Measures%20List.xlsx>.

¹¹⁴⁴ See <https://qpp-cm-prod-content.s3.amazonaws.com/uploads/2617/2024%20QCDR%20Measure%20Specifications.xlsx> for QCDR measures.

¹¹⁴⁵ See the 2024 Improvement Activities Inventory: <https://qpp-cm-prod-content.s3.amazonaws.com/uploads/2644/2024ImprovementActivitiesInv.zip> and 2024 MIPS Data Validation Criteria: <https://qpp-cm-prod-content.s3.amazonaws.com/uploads/2666/2024MIPSDataValidationCriteria.zip> for improvement activity details.

¹¹⁴⁶ See the 2024 Cost Measures Inventory: <https://qpp.cms.gov/mips/explore-measures?tab=costMeasures&py=2024>.

¹¹⁴⁷ See the 2024 Promoting Interoperability Measure Specifications: <https://qpp-cm-prod-content.s3.amazonaws.com/uploads/2223/2024%20MIPS%20Promoting%20Interoperability%20Measure%20Specifications.zip> for Promoting Interoperability measure details.

- We proposed to eliminate the weighting from improvement activities and provide full credit for the improvement activities performance category when an MVP participant attests to one improvement activity option within the selected MVP. See section IV.A.4.e.(3)(b)(iv) of this final rule for detailed information regarding finalized proposals on the removal of weighting from improvement activities and for detailed information regarding finalized proposals on the reporting requirement changes for improvement activities.
- We proposed to modify IA_ERP_6: COVID-19 Vaccine Achievement for Practice Staff to expand the focus and importance of vaccination status to drive improvement across the practice. We proposed to add the proposed modified IA_ERP_6 to all new and previously finalized MVPs because of the importance of vaccination status in practice settings. See Appendix 2, Improvement Activities: Table B of this final rule for detailed information regarding finalized modifications to IA_ERP_6: COVID-19 Vaccine Achievement for Practice Staff, including the finalized activity ID and title update.

MVP Table Symbol Information and Definitions

Please note the following symbols and definitions used within the MVP tables in the Group A and Group B tables below:

- Quality measures, improvement activities, and cost measures proposed for addition to a previously finalized MVP are identified with a plus sign (+) within the Group B MVP tables in this appendix.
- New quality measures, improvement activities, and cost measures proposed for inclusion in MIPS beginning with the CY 2025 performance period/2027 MIPS payment year and future years are identified with a caret symbol (^). See Appendix 1, MIPS Quality Measures: Table Group A of this final rule for further information regarding new MIPS quality measures. See Appendix 2: Improvement Activities: Table A of this final rule for further information regarding new improvement activities. See section IV.A.4.e.(2)(a)(ii) of this final rule for further information regarding new cost measures.
- Existing measures and improvement activities with revisions are identified with a single asterisk (*). See Appendix 1, MIPS Quality Measures: Table Group D of this final rule for further information regarding proposed revisions to MIPS quality measures. See Appendix 2: Improvement Activities: Table B of this final rule for further information regarding proposed revisions to improvement activities. See section IV.A.4.e.(2)(a)(iii) of this final rule for further information regarding proposed revisions to cost measures. We intend to include existing measures or activities with proposed revisions in MVPs (as applicable) regardless of whether the proposed revisions are finalized beginning with the CY 2025 performance period/2027 MIPS payment year.
- Quality measures and improvement activities identified with a double asterisk (**) can only be submitted when included in an MVP.
- Quality measures considered high priority (as defined in § 414.1305) are identified with a single exclamation point (!) while outcome measures (as defined in § 414.1305) are identified with a double exclamation point (!!). Further details of these types of measures are in the CMS Measures Management System Hub.¹¹⁴⁸
- Quality measures and improvement activities that include a health equity component are identified with a tilde (~) within the MVP table.
- Quality measure collection types are identified in parentheses after each quality measure title, and improvement activity medium/high weight designations are identified in parentheses after each improvement activity

¹¹⁴⁸ See <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf>.

Group A: New MVPs Proposed for the CY 2025 Performance Period/2027 MIPS Payment Year and Future Years

A.1 Complete Ophthalmologic Care MVP

In the CY 2025 PFS proposed rule (89 FR 62583 through 62588), we proposed and solicited comments on the Complete Ophthalmologic Care MVP. The proposed Complete Ophthalmologic Care MVP focuses on assessing meaningful outcomes in cataract, glaucoma, retinal detachment, and broadly applicable ocular care. This MVP would be most applicable to clinicians who treat patients within the practice of ophthalmology and optometry. The summary of the public comments received and our responses for this MVP are included immediately after Table A.1b.

Quality Measures

We proposed to include 18 MIPS quality measures and 6 QCDR measures within the quality performance category of this MVP, which are specific to the clinical topic of ocular care by assessing ocular health and treatment of disorders attributed to diabetes related disease, glaucoma, retinal detachment, and cataracts. We reviewed the MIPS quality measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine which quality measures best represent the clinical topic of this MVP.

The following quality measures provide a meaningful and comprehensive assessment of the clinical care for clinicians who specialize in ocular care:

- Q012: Primary Open-Angle Glaucoma (POAG): Optic Nerve Evaluation: This MIPS quality measure evaluates changes in the optic nerve which define the progression and worsening of glaucoma disease status.
- Q019: Diabetic Retinopathy: Communication with the Physician Managing Ongoing Diabetes Care: This MIPS quality measure focuses on the communication between the primary physician managing ongoing care and the physician performing the dilated macular or fundus exam on patients with diabetic retinopathy.
- Q117: Diabetes: Eye Exam: This MIPS quality measure supports eye screening for diabetic retinal disease.
- Q141: Primary Open-Angle Glaucoma (POAG): Reduction of Intraocular Pressure (IOP) by 20% OR Documentation of a Plan of Care: This MIPS quality measure focuses on glaucoma treatment and follow up, ensuring the IOP is within a range at which visual field loss is unlikely to significantly reduce a patient's health-related quality of life over their lifetime.
- Q191: Cataracts: 20/40 or Better Visual Acuity within 90 Days Following Cataract Surgery: This MIPS quality measure evaluates visual acuity as a surgical outcome following cataract surgery.
- Q303: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery: This MIPS quality measure looks for improvement in visual function following cataract surgery.
- Q304: Cataracts: Patient Satisfaction within 90 Days Following Cataract Surgery: This MIPS quality measure assesses patient satisfaction following cataract surgery. Patient satisfaction is a valuable performance indicator for measuring quality of care delivered by clinicians providing cataract surgery. Patient satisfaction is an assessment of the patient's experience with the care process delivered by the clinician and health care services.
- Q384: Adult Primary Rhegmatogenous Retinal Detachment Surgery: No Return to the Operating Room Within 90 Days of Surgery: This MIPS quality measure assesses for successful surgical procedures by evaluating if patients required a return to the operation room or not.
- Q385: Adult Primary Rhegmatogenous Retinal Detachment Surgery: Visual Acuity Improvement Within 90 Days of Surgery: This MIPS quality measure assesses for successful surgical procedures by evaluating if patients showed improvement of visual acuity following surgery as compared to their preoperative level.
- Q389: Cataract Surgery: Difference Between Planned and Final Refraction: This MIPS quality measure evaluates patients for achieving a final refraction within +/- 1.0 diopters of their planned (target) refraction following cataract surgery.
- Q499: Appropriate Screening and Plan of Care for Elevated Intraocular Pressure Following Intravitreal or Periocular Steroid Therapy: This MIPS quality measure focuses on patient safety and ensures appropriate screening and plan of care for elevated intraocular pressure following treatment with intravitreal or periocular steroid.
- Q500: Acute Posterior Vitreous Detachment Appropriate Examination and Follow-up: This MIPS quality measure evaluates patients following acute posterior vitreous detachment to ensure prompt and appropriate care to minimize potential for complications.
- Q501: Acute Posterior Vitreous Detachment and Acute Vitreous Hemorrhage Appropriate Examination and Follow-up: This MIPS quality measure evaluates patients following acute posterior vitreous detachment and acute vitreous hemorrhage to ensure prompt and appropriate care to minimize potential for complications.
- IRIS2: Glaucoma – Intraocular Pressure Reduction: This QCDR measure focuses on glaucoma patients to assess management of their IOP by evaluating if it is below a threshold level based on severity of their glaucoma.
- IRIS13: Diabetic Macular Edema – Loss of Visual Acuity: This QCDR measure evaluates outcomes of treatment for diabetic macular edema by assessing for change in visual acuity after treatment.
- IRIS39: Intraocular Pressure Reduction Following Trabeculectomy or an Aqueous Shunt Procedure: This QCDR measure assesses for successful treatment of patients with glaucoma who have undergone trabeculectomy or an aqueous shunt procedure by evaluating for intraocular pressure reduction.

- IRIS54: Complications After Cataract Surgery: This QCDR measure assesses for successful cataract surgeries by reviewing patients for complications within 90 days of the procedure.
- IRIS58: Improved Visual Acuity after Vitrectomy for Complications of Diabetic Retinopathy within 120 Days: This QCDR measure assesses for successful vitrectomy procedure in patients with diabetic retinopathy by reviewing patients for complications within 120 days of the procedure.
- IRIS61: Visual Acuity Improvement Following Cataract Surgery and Minimally Invasive Glaucoma Surgery: This QCDR measure evaluates visual acuity as a surgical outcome following cataract surgery and minimally invasive glaucoma surgery.

The following broadly applicable MIPS quality measures are relevant to clinicians who specialize in ocular care. The quality measures below assess for age-specific screenings and the patients' understanding of engagement in their healthcare:

- Q130: Documentation of Current Medications in the Medical Record: This MIPS quality measure bases performance on clinicians documenting the list of current medications using all immediate resources for capture of this important clinical topic.
- Q226: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention: This MIPS quality measure ensures patients are screened for tobacco use and if screened positive receive tobacco cessation intervention.
- Q374: Closing the Referral Loop: Receipt of Specialist Report: This MIPS quality measure is attributable to the clinician referring the patient and ensures report receipt from the referred to clinician, closing the communication loop.
- Q487: Screening for Social Drivers of Health: This MIPS quality measure ensures adults are screened for food insecurity, housing instability, transportation needs, utility difficulties, and interpersonal safety.
- Q503: Gains in Patient Activation Measure (PAM®) Scores at 12 Months: This MIPS quality measure ensures capture of the patient voice and experience of care related to the patient's understanding and confidence in the clinician's ability to manage their health and be an active partner in the health care journey.

Improvement Activities

We reviewed the Improvement Activities Inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of improvement activities to include in this MVP. We proposed to include 14 improvement activities that reflect actions and processes undertaken by clinicians who specialize in ocular care, as well as activities that promote patient engagement and patient-centeredness, health equity, shared decision making, and care coordination. These improvement activities provide opportunities for clinicians, in collaboration with patients, to drive outcomes and improve quality of care. The following improvement activities are proposed for inclusion in this MVP:

- IA_AHE_1: Enhance Engagement of Medicaid and Other Underserved Populations
- IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols
- IA_BE_4: Engagement of patients through implementation of improvements in patient portal
- IA_BE_6: Regularly Assess Patient Experience of Care and Follow Up on Findings
- IA_BE_25: Drug Cost Transparency
- IA_CC_9: Implementation of practices/processes for developing regular individual care plans
- IA_CC_10: Care transition documentation practice improvements
- IA_CC_13: Practice improvements to align with OpenNotes principles
- IA_ERP_6: COVID-19 Vaccine Achievement for Practice Staff (modified to IA_PM_26)
- IA_MVP: Practice-Wide Quality Improvement in MIPS Value Pathways
- IA_PCMH: Electronic submission of Patient Centered Medical Home accreditation
- IA_PM_13: Chronic care and preventative care management for empaneled patients
- IA_PM_16: Implementation of medication management practice improvements
- IA_PSPA_7: Use of QCDR data for ongoing practice assessment and improvements

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Cost Measures

We proposed to include one MIPS cost measure within the cost performance category of this MVP, which applies to the clinical topic of ocular care. We reviewed the MIPS cost measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of cost measures to include in this MVP. The following cost measure provides a meaningful assessment of the clinical care for clinicians who specialize in ocular care, specifically cataract removal, and aligns with other measures and activities within this MVP:

- Routine Cataract Removal with Intraocular Lens (IOL) Implantation: This MIPS episode-based cost measure assesses costs associated with routine cataract removal. The addition of this measure aligns with included quality measures, such as Q191: Cataracts: 20/40 or Better Visual Acuity within 90 Days Following Cataract Surgery and Q303: Cataracts: Improvement in Patient's Visual Function within 90 Days Following Cataract Surgery.

We proposed to modify the Routine Cataract Removal with Intraocular Lens (IOL) Implantation cost measure, which included a measure title update to Cataract Removal with Intraocular Lens (IOL) Implantation. Please see section IV.A.4.e(2)(a)(iii) of this final rule for all finalized revisions to this cost measure.

Complete Ophthalmologic Care MVP Tables

Tables A.1a and A.1b serve to represent the measures and activities that are finalized within the Complete Ophthalmologic Care MVP.

Symbol Key:

- Single asterisk (*): existing measures and improvement activities with revisions
- Double asterisk (**): measures and improvement activities only available when included in an MVP
- Single exclamation point (!): high priority measures
- Double exclamation point (!!): outcome measures
- Tilde (~): measures and improvement activities that include a health equity component

The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for this MVP as proposed. One commenter recommended the inclusion of more patient-centered measures in the MVP. For example, measures vetted by the Core Quality Measures Collaborative (CQMC) with consumer input, measures of patient outcomes, patient-reported measures, as well as new approaches to the evaluation of patient experience. One commenter supported the inclusion of the Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols improvement activity in this MVP.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter was opposed to the inclusion of the population health measures in this MVP. The commenter does not believe claims-based population health measures are applicable to ophthalmologists. The commenter stated that administrative claims-based quality measures have a high potential for holding clinicians accountable for care they do not provide, meaning clinicians have limited ability to influence their performance on them.

Response: The population health measures are part of the foundational layer included in all MVPs. If the case minimum is not met for the population health measures, they will be excluded from scoring. For further details on the population health measures included in the foundational layer, see CY 2022 PFS final rule (86 FR 65408 through 65409).

Comment: One commenter recommended specialty groups be provided the opportunity to determine if the measures included in an MVP are appropriate and operationally reasonable.

Response: We post MVP candidates to the QPP website for public feedback for up to a 45-day window to further engage with interested parties on MVP candidates prior to rulemaking. In addition, interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP

website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP. We will also continue to monitor this MVP and make revisions as appropriate based upon interested party feedback and MIPS quality measure inventory changes.

Comment: One commenter recommended leveraging the IRIS Registry measures in supporting meaningful eye-care related MVPs. One commenter recommended a few improvement activities be added to this MVP: IA_AHE_7: Comprehensive Eye Exams, IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record, IA_PSPA_7: Use of QCDR data for ongoing practice assessment and improvements, and IA_PSPA_2: Participation in MOC Part IV.

Response: We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter stated that the measures in this MVP may disadvantage ophthalmic practices in MIPS by limiting the maximum Quality score achievable under this MVP. The commenter explained small and rural practices are less likely to have the resources available to adopt EHRs. These practices would be further disadvantaged under this MVP candidate as they would not be able to report eCQMs and, thus, would be limited to lower scoring manual measures. Moreover, due to the smaller number of patients seen, singular adverse events will have a substantially greater impact on small practices than large practices in this MVP because they will be unable to choose measures with less clustered performance rates.

Response: We acknowledge the commenters' concerns regarding quality scoring. There are currently 24 quality and QCDR measures available in the MVP, 17 of which have a benchmark and 4 showing a 7-point cap. While we endeavor to include measures that allow for maximum points, we want to ensure important aspects of care within the MVP clinical topic are represented. Currently, this MVP aligns with the Ophthalmology specialty measure set, excluding only two measures, and therefore, should not adversely affect those clinicians who choose to report the MVP versus traditional MIPS. However, as MVPs are optional and there is clinician choice allowed in quality performance reporting, we would encourage clinicians to review each MVP and the measures and activities within to ensure it is appropriate and applicable to them prior to reporting.

Comment: Several commenters expressed opposition to this MVP and stated that it would be appropriate to limit the first ophthalmic MVP to cataract surgery. Commenters stated their belief that the MVP is not feasible given the complexity of properly representing ophthalmic subspecialties in both the cost and quality performance categories. The commenters noted that the cost measure proposed in this MVP applies only to cataract surgery, putting cataract surgeons at a disadvantage compared to other ocular care clinicians.

Response: The MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting, which would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician's scope of care. We understand that not all measures are applicable to all clinicians who would choose to report this MVP. However, this represents the foundation from which to build the most meaningful MVP addressing ophthalmologic care and allows for clinician choice in choosing quality measures that best represent their practice.

Currently, there are no additional applicable episode-based cost measures available for use in this MVP beyond the Cataract Removal with Intraocular Lens (IOL) Implantation cost measure. Should additional applicable cost measures become available for use in MVPs, interested parties are welcome to submit recommended changes to the MVP through the MVP Maintenance Process. Until such time, ophthalmologists can choose to report this MVP. If a clinician cannot be scored on any of the cost measures within an MVP they choose to report (see § 414.1380(b)(2)(v)), the cost performance category will be reweighted in alignment with existing MIPS scoring policies (§ 414.1380(c)) and the clinician will not be penalized if there is not a cost measure applicable to their clinical practice.

After consideration of public comments, we are finalizing the *Complete Ophthalmologic Care MVP* with modifications in Table A.1a and as proposed in Table A.1b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal.

A.2 Dermatological Care MVP

In the CY 2025 PFS proposed rule (89 FR 62588 through 62592), we proposed and solicited comments on the Dermatological Care MVP. The proposed Dermatological Care MVP focuses on the clinical theme of providing treatment and management of dermatologic care. This MVP will be most applicable to clinicians who treat patients within the practice of dermatology, including nonphysician practitioners (NPPs) such as nurse practitioners and physician assistants. The summary of the public comments received and our responses for this MVP are included immediately after Table A.2b.

Quality Measures

We proposed to include 11 MIPS quality measures and 6 QCDR measure within the quality performance category of this MVP, which are specific to the clinical topic of dermatology. We reviewed the MIPS quality measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine which quality measures best represent the clinical topic of this MVP.

The following quality measures provide a meaningful and comprehensive assessment of the clinical care for clinicians who specialize in dermatology:

- Q176: Tuberculosis Screening Prior to First Course of Biologic and/or Immune Response Modifier Therapy: This MIPS quality measure ensures TB testing is completed prior to the first course of biologic and/or immune response modifier therapy.
- Q397: Melanoma Reporting: This MIPS quality measure assesses that the pathology report for primary malignant cutaneous melanoma includes reporting identifiers needed for microsatellitosis of invasive tumors.
- Q410: Psoriasis: Clinical Response to Systemic Medications: This MIPS quality measure ensures patients with psoriasis vulgaris who are being treated with systemic medications maintain disease control by evaluating documented body surface assessments meet at least one of the specified benchmarks.
- Q440: Skin Cancer: Biopsy Reporting Time – Pathologist to Clinician: This MIPS quality measure ensures pathology reports diagnosing carcinoma or melanoma are communicated from the Pathologist/Dermatopathologist within 7 days from the Pathologist receiving the specimen.
- Q485: Psoriasis – Improvement in Patient-Reported Itch Severity: This MIPS quality measure evaluates patients with a diagnosis of psoriasis for a reduction in itch severity of 3 or more points at follow up visits.
- Q486: Dermatitis – Improvement in Patient-Reported Itch Severity: This MIPS quality measure evaluates patients with a diagnosis of dermatitis for a reduction in itch severity of 3 or more points at follow up visits.
- Q509: Melanoma: Tracking and Evaluation of Recurrence: This proposed MIPS quality measure ensures patients who undergo excisional surgery for melanoma or melanoma in situ within the previous 5 years have documentation that an exam for recurrence of melanoma was performed within the performance period and results captured.
- AAD6: Skin Cancer: Biopsy Reporting Time – Clinician to Patient: This QCDR measure ensures timely communication from the clinician to the patient when they have a positive finding for carcinoma, melanoma, or primary cutaneous malignancies.
- AAD8: Chronic Skin Conditions: Patient Reported Quality-of-Life: This QCDR measure ensures a patient-reported quality-of-life assessment is completed and recorded in the medical record with a plan of care at least once in the performance period.
- AAD12: Melanoma: - Appropriate Surgical Margins: This QCDR measure ensures the initial biopsy and surgical margins are documented in the medical record and are in compliance with the minimum margin recommended in the current National Comprehensive Cancer Network (NCCN) guideline.
- AAD16: Avoidance of Post-operative Systemic Antibiotics for Office-based Closures and Reconstruction After Skin Cancer Procedures: This QCDR measure assesses for the appropriate use of post operative antibiotics for patients with skin cancer undergoing an office-based closure or reconstruction procedure.
- AAD17: Continuation of Anticoagulation Therapy in the Office-based Setting for Closure and Reconstruction After Skin Cancer Resection Procedures: This QCDR measure assesses the percentage of patients who had their anticoagulation therapy continued prior to an in-office procedure for intermediate layer and/or complex linear closures OR reconstruction after skin cancer resection performed.
- AAD18: Avoidance of Opioid Prescriptions for Closure and Reconstruction After Skin Cancer Resection: This QCDR measure identifies the number of patients diagnosed with skin cancer who were prescribed an opioid/narcotic therapy as a first line pain management option post-operative by the reconstructing surgeon.

The following broadly applicable MIPS quality measures are relevant to clinicians who specialize in dermatology. The quality measures below assess for age-specific screenings, and follow-up actions for select measures:

- Q130: Documentation of Current Medications in the Medical Record: This MIPS quality measure bases performance on clinicians documenting the list of current medications using all immediate resources for capture of this important clinical topic.
- Q226: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention: This MIPS quality measure ensures patients are screened for tobacco use and if screened positive receive tobacco cessation intervention.
- Q487: Screening for Social Drivers of Health: This MIPS quality measure ensures adults are screened for food insecurity, housing instability, transportation needs, utility difficulties, and interpersonal safety.
- Q503: Gains in Patient Activation Measure (PAM®) Scores at 12 Months: This MIPS quality measure ensures capture of the patient voice and experience of care related to the patient's understanding and confidence in the clinician's ability to manage their health and be an active partner in the health care journey.

Improvement Activities

We reviewed the Improvement Activities Inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of improvement activities to include in this MVP. We proposed to include 11 improvement activities that reflect actions and processes undertaken by clinicians who specialize in dermatology, as well as activities that promote patient engagement and patient-centeredness, health equity, shared decision making, and care coordination. These improvement

activities provide opportunities for clinicians, in collaboration with patients, to drive outcomes and improve quality of care. The following improvement activities are proposed for inclusion in this MVP:

- IA_AHE_1: Enhance Engagement of Medicaid and Other Underserved Populations
- IA_AHE_6: Provide Education Opportunities for New Clinicians
- IA_BE_4: Engagement of patients through implementation of improvements in patient portal
- IA_BE_6: Regularly Assess Patient Experience of Care and Follow Up on Findings
- IA_BE_15: Engagement of patients, family and caregivers in developing a plan of care
- IA_EPA_2: Use of telehealth services that expand practice access
- IA_ERP_6: COVID-19 Vaccine Achievement for Practice Staff (modified to IA_PM_26)
- IA_MVP: Practice-Wide Quality Improvement in MIPS Value Pathways
- IA_PCMH: Electronic submission of Patient Centered Medical Home accreditation
- IA_PM_16: Implementation of medication management practice improvements
- IA_PSPA_8: Use of Patient Safety Tools

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which includes a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Cost Measures

We proposed to include one MIPS cost measure within the cost performance category of this MVP, which applies to the clinical topic of dermatology. We reviewed the MIPS cost measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of cost measures to include in this MVP. The following cost measure provides a meaningful assessment of the clinical care for clinicians who specialize in dermatology, specifically melanoma resection, and aligns with other measures and activities within this MVP:

- Melanoma Resection: This MIPS episode-based cost measure assesses costs associated with excision procedures to remove a cutaneous melanoma. The addition of this measure aligns with Q397: Melanoma Reporting and Q509: Melanoma: Tracking and Evaluation of Recurrence.

Dermatological Care MVP Tables

Tables A.2a and A.2b serve to represent the measures and activities that are finalized within the Dermatological Care MVP.

Symbol Key:

- Caret symbol (^): new proposed measures and improvement activities
- Single asterisk (*): existing measures and improvement activities with revisions
- Double asterisk (**): measures and improvement activities only available when included in an MVP
- Single exclamation point (!): high priority measures
- Double exclamation point (!!): outcome measures
- Tilde (~): measures and improvement activities that include a health equity component

The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for this MVP as proposed. One commenter recommended the inclusion of more patient-centered measures in the MVP. For example, measures vetted by the Core Quality Measures Collaborative (CQMC) with consumer input, measures of patient outcomes, patient-reported measures, as well as new approaches to the evaluation of patient experience.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter recommended the removal of the pathology specific quality measures from this MVP. The commenter stated their belief that evaluating pathologists solely on dermatology measures does not capture the extent of the practice of pathology and could lead to confusion among single specialty pathology practices. Furthermore, the presence of only two quality measures in the MVP prevents pathologists from fully participating.

Response: We appreciate the commenters concerns. The MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care, such as dermatopathology. We understand that not all measures are applicable to all clinicians who would choose to report this MVP; however, reporting MVPs is voluntary at this time. We maintain that this represents the foundation from which to build the most meaningful MVP addressing dermatological care and allows for clinician choice in choosing quality measures that best represent their practice. For guidance, please note that as stated above, this MVP is most applicable to dermatologists and is not directed towards pathology alone.

Comment: Several commenters recommend narrowing the scope of this MVP to focus on skin cancer, a neoplastic disease, which has a cost measure and clinically relevant quality measures, allowing for meaningful measurement. One commenter stated their belief that the broad Dermatological Care MVP will inevitably lead to unfair comparisons among dermatologists with varying subspecializations and patient populations. Another commenter expressed concerns with the MVP as proposed, particularly the singular cost outcome focused on melanoma resection which would be limited to those practices with a Mohs surgeon.

Response: The MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting which would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician's scope of care. We understand that not all measures are applicable

to all clinicians who would choose to report this MVP. However, this represents the foundation from which to build the most meaningful MVP addressing dermatological care and allows for clinician choice in choosing quality measures that best represent their practice.

Currently, there are no additional applicable episode-based cost measures available for use in this MVP beyond the Melanoma Resection cost measure. Should additional applicable cost measures become available for use in MVPs, interested parties are welcome to submit recommended changes to the MVP through the MVP Maintenance Process. Until such time, dermatologists can choose to report this MVP. We note that this cost measure assesses costs related to melanoma resection procedures but does not include Mohs procedures. If a clinician cannot be scored on any of the cost measures within an MVP they choose to report (see § 414.1380(b)(2)(v)), the cost performance category will be reweighted in alignment with existing MIPS scoring policies (§ 414.1380(c)) and the clinician will not be penalized if there is not a cost measure applicable to their clinical practice..

Comment: One commenter recommended specialty groups be provided the opportunity to determine if the measures included are appropriate and operationally reasonable.

Response: We post MVP candidates to the QPP website for public feedback for up to a 45-day window to further engage with interested parties on MVP candidates prior to rulemaking. In addition, interested parties are welcome to submit recommended changes to an MVP on an ongoing basis through the MVP Maintenance Process. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP. We will also continue to monitor this MVP and make revisions as appropriate based upon interested party feedback and MIPS quality measure inventory changes.

Comment: One commenter recommended the inclusion of the following quality measures to provide participants with a full choice of potentially relevant measures: Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented, Q374: Closing the Referral Loop: Receipt of Specialist Report, and Q498: Connection to Community Service Provider. In addition, the commenter recommended the inclusion of the following improvement activities to ensure broad, applicable improvement activities that reflect current clinical practice of dermatologic care: IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record, IA_CC_1: Implementation of Use of Specialist Reports Back to Referring Clinician or Group to Close Referral Loop, IA_CC_2: Implementation of improvements that contribute to more timely communication of test results, IA_BMH_2: Tobacco use, IA_BE_1: Use of certified EHR to capture patient-reported outcomes, and IA_ERP_4: Implementation of a Personal Protective Equipment (PPE) Plan.

Response: We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP. We note that we proposed and finalized the removal of the following improvement activities recommended by the commenter: IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record and IA_ERP_4: Implementation of a Personal Protective Equipment (PPE) Plan. See Appendix 2, Table C for additional details.

Comment: One commenter recommended this MVP include at least six eQMs. One commenter is concerned that the MVP cannot be reported solely utilizing eQMs. Another commenter stated their belief that quality measure reporting in an MVP should be available using a combination of claims-based reporting and eQMs.

Response: We encourage the development of eQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Annual Call for Quality Measures with an option for the eQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Annual Call for Quality Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eQMs or claims-based to discuss revisions for possible implementation in futures years.

After consideration of public comments, we are finalizing the *Dermatological Care MVP* with modifications in Table A.2a and as proposed in Table A.2b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details.

A.3 Gastroenterology Care MVP

In the CY 2025 PFS proposed rule (89 FR 62593 through 62596), we proposed and solicited comments on the Gastroenterology Care MVP. The proposed Gastroenterology Care MVP focuses on the clinical theme of providing treatment and management of the digestive system and the liver. This MVP will be most applicable to clinicians who treat patients within the practice of gastroenterology, including nonphysician practitioners (NPPs) such as nurse practitioners and physician assistants. The summary of the public comments received and our responses for this MVP are included immediately after Table A.3b.

Quality Measures

We proposed to include 11 MIPS quality measures and 3 QCDR measures within the quality performance category of this MVP, which are specific to the clinical topic of gastroenterology. We reviewed the MIPS quality measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine which quality measures best represent the clinical topic of this MVP.

The following quality measures provide a meaningful and comprehensive assessment of the clinical care for clinicians who specialize in gastroenterology:

- Q113: Colorectal Cancer Screening: This MIPS quality measure ensures appropriate screening of patients for colorectal cancer.
- Q185: Colonoscopy Interval for Patients with a History of Adenomatous Polyps - Avoidance of Inappropriate Use: This MIPS quality measure ensures appropriate follow-up, an interval of 3 or more years, for patients with a history of prior adenomatous polyp(s) in previous colonoscopy.
- Q275: Inflammatory Bowel Disease (IBD): Assessment of Hepatitis B Virus (HBV) Status Before Initiating Anti-TNF (Tumor Necrosis Factor) Therapy: This MIPS quality measure requires patients with a diagnosis of inflammatory bowel disease (IBD) have Hepatitis B Virus (HBV) status assessed prior to initiating anti-TNF (tumor necrosis factor) therapy.
- Q320: Appropriate Follow-Up Interval for Normal Colonoscopy in Average Risk Patients: This MIPS quality measure ensures appropriate follow-up for patients receiving a screening colonoscopy without biopsy or polypectomy.
- Q400: One-Time Screening for Hepatitis C Virus (HCV) and Treatment Initiation: This MIPS quality measure requires patients have received a one-time screening for hepatitis C virus (HCV) infection as well as treatment initiation or referral if screening is positive.
- Q401: Hepatitis C: Screening for Hepatocellular Carcinoma (HCC) in Patients with Cirrhosis: This MIPS quality measure ensures patients with a diagnosis of chronic Hepatitis C cirrhosis have appropriate surveillance imaging for hepatocellular carcinoma at least once during the performance period.
- GIQIC23: Appropriate follow-up interval based on pathology findings in screening colonoscopy: This QCDR measure ensures appropriate follow-up consistent with US Multi-Society Task Force (USMSTF) recommendations based upon pathology findings from screening colonoscopy with biopsy or polypectomy documented in colonoscopy report.
- GIQIC26: Screening Colonoscopy Adenoma Detection Rate: This QCDR measure evaluates patients who had a screening colonoscopy and at least one conventional adenoma or colorectal cancer was detected.
- NHCR4: Repeat screening or surveillance colonoscopy recommended within one year due to inadequate bowel preparation: This QCDR measure ensures patients with inadequate bowel prep receive a repeat screening or surveillance colonoscopy or an alternate tier 1 or tier 2 colorectal cancer screening modality within one year.

The following broadly applicable MIPS quality measures are relevant to clinicians who specialize in gastroenterology. The quality measures below assess for age-specific screenings, and follow-up actions for select measures:

- Q130: Documentation of Current Medications in the Medical Record: This MIPS quality measure bases performance on clinicians documenting the list of current medications using all immediate resources for capture of this important clinical topic.
- Q226: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention: This MIPS quality measure ensures patients are screened for tobacco use and if screened positive receive tobacco cessation intervention.
- Q374: Closing the Referral Loop: Receipt of Specialist Report: This MIPS quality measure is attributable to the clinician referring the patient and ensures report receipt from the referred to clinician, closing the communication loop.
- Q487: Screening for Social Drivers of Health: This MIPS quality measure ensures adults are screened for food insecurity, housing instability, transportation needs, utility difficulties, and interpersonal safety.
- Q503: Gains in Patient Activation Measure (PAM®) Scores at 12 Months: This MIPS quality measure ensures capture of the patient voice and experience of care related to the patient's understanding and confidence in the clinician's ability to manage their health and be an active partner in the health care journey.

Improvement Activities

We reviewed the Improvement Activities Inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of improvement activities to include in this MVP. We proposed to include 11 improvement activities that reflect actions and processes undertaken by clinicians who specialize in gastroenterology, as well as activities that promote patient engagement and patient-centeredness, health equity, shared decision making, and care coordination. These improvement activities provide opportunities for clinicians, in collaboration with patients, to drive outcomes and improve quality of care. The following improvement activities are proposed for inclusion in this MVP:

- IA_AHE_3: Promote Use of Patient-Reported Outcome Tools
- IA_AHE_6: Provide Education Opportunities for New Clinicians
- IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols
- IA_BE_4: Engagement of patients through implementation of improvements in patient portal
- IA_CC_7: Regular training in care coordination
- IA_CC_9: Implementation of practices/processes for developing regular individual care plans
- IA_CC_10: Care transition documentation practice improvements

- IA_CC_13: Practice improvements to align with OpenNotes principles
- IA_ERP_6: COVID-19 Vaccine Achievement for Practice Staff (modified to IA_PM_26)
- IA_MVP: Practice-Wide Quality Improvement in MIPS Value Pathways
- IA_PCMH: Electronic submission of Patient Centered Medical Home accreditation

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Cost Measures

We proposed to include two MIPS cost measures within the cost performance category of this MVP, which apply to the clinical topic of gastroenterology. We reviewed the MIPS cost measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of cost measures to include in this MVP. The following cost measures provide a meaningful assessment of the clinical care for clinicians who specialize in gastroenterology, including colonoscopies and broader gastroenterology care, and align with other measures and activities within this MVP:

- **Screening/Surveillance Colonoscopy:** This MIPS episode-based cost measure assesses costs associated with screening or surveillance colonoscopy procedures. This measure aligns with quality measures such as Q113: Colorectal Cancer Screening or Q320: Appropriate Follow-Up Interval for Normal Colonoscopy in Average Risk Patients.
- **Total Per Capita Cost (TPCC):** This MIPS cost measure assesses the overall cost of care delivered to a Medicare patient with a focus on the primary care the patient receives from their providers. Gastroenterologists are included in attribution for the TPCC measure as they may provide broad, ongoing care to their patients, which is in line with the intent of the TPCC measure.

Gastroenterology Care MVP Tables

Tables A.3a and A.3b serve to represent the measures and activities that are finalized within the Gastroenterology Care MVP.

Symbol Key:

- Single asterisk (*): existing measures and improvement activities with revisions
- Double asterisk (**): measures and improvement activities only available when included in an MVP
- Single exclamation point (!): high priority measures
- Double exclamation point (!!): outcome measures
- Tilde (~): measures and improvement activities that include a health equity component

The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for this MVP as proposed. One commenter supported the inclusion of the Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols improvement activity in this MVP and a couple of commenters supported the inclusion of Q113: Colorectal Cancer Screening measure in this MVP. One commenter recommended the inclusion of more patient-centered measures in the MVP. For example, measures vetted by the Core Quality Measures Collaborative (CQMC) with consumer input, measures of patient outcomes, patient-reported measures, as well as new approaches to the evaluation of patient experience. Another commenter recommended including measures in this MVP for metabolic dysfunction-associated steatohepatitis (MASH), Metabolic dysfunction-associated steatotic liver disease (MASLD), or obesity.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: A few commenters expressed concern that the measure set lacks the ability to measure and evaluate the full spectrum of care under the purview of gastroenterologists, particularly gastroenterologists who subspecialize. One commenter recommended narrowing the scope of this MVP to focus on colorectal cancer prevention.

Response: The MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting which would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician’s scope of care. We understand that not all measures are applicable to all clinicians who would choose to report this MVP. However, this represents the foundation from which to build the most meaningful MVP addressing gastroenterology care and allows for clinician choice in choosing quality measures that best represent their practice.

Comment: One commenter recommended specialty groups be provided the opportunity to determine if the measures included in an MVP are appropriate and operationally reasonable.

Response: We post MVP candidates to the QPP website for public feedback for up to a 45-day window to further engage with interested parties on MVP candidates prior to rulemaking. In addition, interested parties are welcome to submit recommended changes to an MVP on an ongoing basis through the MVP Maintenance Process. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP. We will also continue to monitor this MVP and make revisions as appropriate based upon interested party feedback and MIPS quality measure inventory changes.

Comment: A few commenters expressed concern that specialty care is being assessed through the lens of quality measures and improvement activities that are intended for use by primary care clinicians. The commenters felt that measures like Q113: Colorectal Cancer Screening, Q374: Closing the Referral Loop: Receipt of Specialist Report, and Q487: Screening for Social Drivers of Health are not intended for gastroenterologists; instead, they are geared toward primary care physicians.

Response: We acknowledge that due to nuances in clinician specialization and subsequent scope of care, not all measures will be applicable or appropriate to all clinicians. However, the MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting which would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician's scope of care. While measures Q113: Colorectal Cancer Screening and Q487: Screening for Social Drivers of Health may be perceived as being only applicable to primary care physicians, it would be incumbent upon all clinicians treating each patient to ensure they are providing proper care and are able to support their healthcare journey, driving positive health outcomes. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter recommended this MVP include at least six eQCMs.

Response: We encourage the development of eQCMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eQCM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward for current measures not available as eQCMs to discuss revisions and possible implementation in future years.

Comment: A couple of commenters are concerned with the inclusion of the TPCC measure in this MVP. One commenter suggested that if we do not remove the TPCC measure from MIPS, we should at a minimum remove the TPCC measure from all MVPs that include other episode-based cost measures. Another commenter stated their belief that there is an absence of strong clinical or patient-reported outcome performance measures for high-cost conditions treated by gastroenterologists, such as inflammatory bowel disease. They stated that, without correlating quality measures, there is a possibility that the inclusion of broad population-based cost measures, such as the TPCC measure, that incentivize reduced spending could lead to inappropriate care.

Response: We agree with the commenters that it is important to consider quality performance alongside cost performance. The quality and cost measures included in the Gastroenterology MVP are aligned to focus on screenings performed by gastroenterologists. In addition to the Screening/Surveillance Colonoscopy episode-based cost measure, which assesses costs of care for screening or surveillance colonoscopy procedures, the TPCC measure also captures costs related to ongoing care management provided by gastroenterologists, which align with the quality measures in the MVP that address colonoscopy, inflammatory bowel disease, and care for hepatic disease.

We disagree with the commenter that broad population-based cost measures, such as the TPCC measure, could lead to inappropriate care. The inclusion of broadly applicable measures, such as the TPCC measure, in MVPs encourages clinicians to coordinate with other clinicians in treating a patient to improve overall cost performance. By holding multiple clinicians accountable, this promotes shared responsibility for a patient's care across primary care and specialties who tend to provide ongoing care. Ultimately, cost measures aim to promote care coordination and can capture clinicians' cost savings through reduction of poor patient outcomes associated with high costs, such as potentially avoidable hospitalizations or complications.

After consideration of public comments, we are finalizing the *Gastroenterology Care MVP* with modifications in Table A.3a and as proposed in Table A.3b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details.

A.4 Optimal Care for Patients with Urologic Conditions MVP

In the CY 2025 PFS proposed rule (89 FR 62596 through 62600), we proposed and solicited comments on the Optimal Care for Patients with Urologic Conditions MVP. The proposed Optimal Care for Patients with Urologic Conditions MVP focuses on assessing optimal care for patients treated for a broad range of urologic conditions, including kidney stones, urinary incontinence,

bladder cancer, and prostate cancer. This MVP will be most applicable to clinicians who treat patients within the practice urology including general urologists, urology oncologists, and sub-specialists focused on urology care for women, including nonphysician practitioners (NPPs) such as nurse practitioners and physician assistants. The summary of the public comments received and our responses for this MVP are included immediately after Table A.4b.

Quality Measures

We proposed to include nine MIPS quality measures and five QCDR measure within the quality performance category of this MVP, which are specific to the clinical topic of urology. We reviewed the MIPS quality measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine which quality measures best represent the clinical topic of this MVP.

The following quality measures provide a meaningful and comprehensive assessment of the clinical care for clinicians who specialize in urology:

- Q050: Urinary Incontinence: Plan of Care for Urinary Incontinence in Women Aged 65 Years and Older: This MIPS quality measure ensures patients have a documented plan of care for urinary incontinence at least once within 12 months.
- Q462: Bone Density Evaluation for Patients with Prostate Cancer and Receiving Androgen Deprivation Therapy: This MIPS quality measure ensures patients with prostate cancer currently on or starting androgen deprivation therapy (ADT), with an intent for treatment greater than or equal to 12 months, have a bone density evaluation prior to starting or within 3 months after the start of ADT.
- Q476: Urinary Symptom Score Change 6-12 Months After Diagnosis of Benign Prostatic Hyperplasia: This MIPS quality measure assesses for improvement in urinary symptoms for patients with a diagnosis of benign prostatic hyperplasia based upon the International Prostate Symptoms Score (IPSS) or American Urological Association (AUA) Symptom Index (SI).
- Q481: Intravesical Bacillus-Calmette Guerin for Non-muscle Invasive Bladder Cancer: This MIPS quality measure ensures patients initially diagnosed with non-muscle invasive bladder cancer have treatment initiated within 6 months of the cancer staging.
- AQUA8: Hospital Admissions or Infectious Complications Within 30 days of Prostate Biopsy: This QCDR measure assesses the number of patients who have urinary retention, infection, or a new antibiotic prescription at least 24 hours after and within 30 days of a prostate biopsy or inpatient consultation or require hospitalization within 30 days of prostate biopsy.
- AQUA14: Stones: Repeat Shock Wave Lithotripsy (SWL) Within 6 Months of Initial Treatment: This QCDR measure assesses the number of patients who had a repeat shock wave lithotripsy procedure within the 6 months of the initial treatment.
- AQUA15: Stones: Urinalysis or Urine Culture Performed Before Surgical Stone Procedures: This QCDR measure ensures patients have a urinalysis or culture within 14 days prior to surgical stone procedures.
- AQUA16: Non-Muscle Invasive Bladder Cancer: Repeat Transurethral Resection of Bladder Tumor (TURBT) for T1 disease: This QCDR measure assesses the number of patients who undergo a second TURBT within 6 weeks of the initial procedure.
- MUSIC4: Prostate Cancer: Active Surveillance/Watchful Waiting for Newly Diagnosed LowRisk Prostate Cancer Patients: This QCDR measure ensures newly diagnosed low-risk prostate cancer patients are managed via active surveillance or watchful waiting to maintain the patient's quality of life.

The following broadly applicable MIPS quality measures are relevant to clinicians who specialize in urology. The measures assess for age-specific screenings, and follow-up actions for select measures, in addition to recommended vaccinations:

- Q318: Falls: Screening for Future Fall Risk: This MIPS quality measure ensures patients are screened each performance period for future fall risk.
- Q321: CAHPS for MIPS Clinician/Group Survey: This survey provides direct input from patients and their experience regarding timely care, effective communication, shared decision making, care coordination, promotion of health and education, completion of health status/functionality, and courtesy of office staff.
- Q358: Patient-Centered Surgical Risk Assessment and Communication: This MIPS quality measure ensures a personalized surgical risk assessment is completed on each patient using a validated risk calculator or multi-institutional clinical data prior to the surgery along with discussion of the identified risks with the surgeon.
- Q487: Screening for Social Drivers of Health: This MIPS quality measure ensures adults are screened for food insecurity, housing instability, transportation needs, utility difficulties, and interpersonal safety.
- Q503: Gains in Patient Activation Measure (PAM®) Scores at 12 Months: This MIPS quality measure ensures capture of the patient voice and experience of care related to the patient's understanding and confidence in the clinician's ability to manage their health and be an active partner in the health care journey.

Improvement Activities

We reviewed the Improvement Activities Inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of improvement activities to include in this MVP. We proposed to include 17 improvement activities that reflect actions and processes undertaken by clinicians who specialize in urology, as well as activities that promote patient

engagement and patient-centeredness, health equity, shared decision making, and care coordination. These improvement activities provide opportunities for clinicians, in collaboration with patients, to drive outcomes and improve quality of care. The following improvement activities are proposed for inclusion in this MVP:

- IA_AHE_3: Promote Use of Patient-Reported Outcome Tools
- IA_AHE_12: Practice Improvements that Engage Community Resources to Address Drivers of Health
- IA_BE_6: Regularly Assess Patient Experience of Care and Follow Up on Findings
- IA_BE_15: Engagement of patients, family and caregivers in developing a plan of care
- IA_CC_7: Regular training in care coordination
- IA_CC_13: Practice improvements to align with OpenNotes principles
- IA_CC_17: Patient Navigator Program
- IA_EPA_2: Use of telehealth services that expand practice access
- IA_ERP_6: COVID-19 Vaccine Achievement for Practice Staff (modified to IA_PM_26)
- IA_MVP: Practice-Wide Quality Improvement in MIPS Value Pathways
- IA_PCMH: Electronic submission of Patient Centered Medical Home accreditation
- IA_PM_17: Participation in Population Health Research
- IA_PM_21: Advance Care Planning
- IA_PSPA_7: Use of QCDR data for ongoing practice assessment and improvements
- IA_PSPA_12: Participation in private payer CPIA
- IA_PSPA_19: Implementation of formal quality improvement methods, practice changes or other practice improvement processes
- IA_PSPA_21: Implementation of fall screening and assessment programs

Cost Measures

We proposed to include three MIPS cost measures within the cost performance category of this MVP, which apply to the clinical topic of urology. We reviewed the MIPS cost measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of cost measures to include in this MVP. The following cost measures provide a meaningful assessment of the clinical care for clinicians who specialize in urology and align with other measures and activities within this MVP:

- Medicare Spending Per Beneficiary (MSPB) Clinician: This MIPS cost measure applies to clinicians providing care in inpatient hospitals, including those who treat patients with urology-related conditions or procedures.
- Renal or Ureteral Stone Surgical Treatment: This MIPS episode-based cost measure assesses costs associated with surgical treatment for renal or ureteral stones. This also aligns with quality measures such as AQUA14: Stones: Repeat Shock Wave Lithotripsy (SWL) Within 6 Months of Initial Treatment or AQUA15: Stones: Urinalysis or Urine Culture Performed Before Surgical Stone Procedures.
- Prostate Cancer: This proposed MIPS episode-based cost measure will assess costs associated with prostate cancer. This also aligns with quality measures such as Q462: Bone Density Evaluation for Patients with Prostate Cancer and Receiving Androgen Deprivation Therapy or MUSIC4: Prostate Cancer: Active Surveillance/Watchful Waiting for Newly Diagnosed LowRisk Prostate Cancer Patients.

Optimal Care for Patients with Urologic Conditions MVP Tables

Tables A.4a and A.4b serve to represent the measures and activities that are finalized within the Optimal Care for Patients with Urologic Conditions MVP.

Symbol Key:

Caret symbol (^): new proposed measures and improvement activities

Single asterisk (*): existing measures and improvement activities with revisions

Double asterisk (**): measures and improvement activities only available when included in an MVP

Single exclamation point (!): high priority measures

Double exclamation point (!!): outcome measures

Tilde (~): measures and improvement activities that include a health equity component

TABLE A.4a: Optimal Care for Patients with Urologic Conditions MVP Measures and Improvement Activities

Quality	Improvement Activities	Cost
<p>(!) Q050: Urinary Incontinence: Plan of Care for Urinary Incontinence in Women Aged 65 Years and Older (Collection Type: MIPS CQM Specifications)</p> <p>(!) The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for this MVP as proposed. One commenter recommended the inclusion of more patient-centered measures in the MVP. For example, measures vetted by the Core Quality Measures Collaborative (CQMC) with consumer input, measures of patient outcomes, patient-reported measures, as well as new approaches to the evaluation of patient experience. A couple of commenters recommended the addition of two additional improvement activities related to bladder cancer care; IA_CC_12: Care Coordination Agreements that Promote Improvements in Patient Tracking Across Settings and IA_PSPA_8: Use of Patient Safety Tools.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter recommended this MVP be modified to be more meaningful and directly beneficial to both physicians and their patients, reflecting the real-world clinical scenarios and challenges faced in practice.

Response: The MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting which would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician's scope of care. We understand that not all quality measures are applicable to all clinicians who would choose to report this MVP; however, this represents the foundation from which to build the most meaningful MVP addressing urological care and allows for clinician choice in choosing quality measures that best represent their practice.

Comment: One commenter recommended specialty groups be provided the opportunity to determine if the measures included are appropriate and operationally reasonable.

Response: We post MVP candidates to the QPP website for public feedback for up to a 45-day window to further engage with interested parties on MVP candidates prior to rulemaking. In addition, interested parties are welcome to submit recommended changes to an MVP on an ongoing basis through the MVP Maintenance Process. Guidance on how to submit recommended changes

to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP. We will also continue to monitor this MVP and make revisions as appropriate based upon interested party feedback and MIPS quality measure inventory changes.

Comment: One commenter recommended this MVP include at least six eQMs.

Response: We encourage the development of eQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eQCM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eQMs to discuss revisions for possible implementation in future years.

Comment: A couple of commenters recommended the removal of IA_ERP_6: COVID-19 Vaccine Achievement for Practice Staff from this MVP. The commenters stated their belief that a focus on this activity might shift focus from improvement activities that are more clinically relevant to urology and align more closely with the quality measures included in the MVP.

Response: We appreciate commenters' feedback. This activity was proposed for inclusion in all MVPs because of the importance of vaccination status in practice settings; we consider this activity to be of significant public-health importance.

Comment: A few commenters recommended the removal of the Medicare Spending Per Beneficiary (MSPB) Clinician cost measure from this MVP. The commenters expressed concern about the potential attribution of cases to consultant urologists, even though they likely have little control over the cost of the hospital episodes.

Response: The MSPB Clinician cost measure is appropriate for use in this MVP, as it assesses costs associated with inpatient hospitalizations for urologic conditions, including those not captured by the episode-based cost measures we also proposed for inclusion in this MVP. The MSPB Clinician measure is designed to assess costs associated with inpatient hospitalizations that can be influenced by a clinician's care decisions, including urologists who practice in an inpatient setting and provide care such as bladder and urinary tract procedures.

Comment: A couple of commenters were opposed to the inclusion of the proposed, new Prostate Cancer episode-based cost measure in this MVP. One commenter is concerned the risk adjustment methodology for the proposed Prostate Cancer measure is insufficient to accurately account for variation in costs due to disease severity. Furthermore, commenters stated their belief that, without substantial measure testing to understand unintended consequences, they are concerned adoption of this measure could result in care stinting. These commenters stated that this is of particular risk for advanced prostate cancer, which may necessitate genetic or mutation testing, advanced imaging, or novel treatments.

Response: The new Prostate Cancer episode-based cost measure (which we are finalizing) is appropriate for use in this MVP, as it assesses costs associated with prostate cancer and aligns with Q462: Bone Density Evaluation for Patients with Prostate Cancer and Receiving Androgen Deprivation Therapy and MUSIC4: Prostate Cancer: Active Surveillance/Watchful Waiting for Newly Diagnosed LowRisk Prostate Cancer Patients. Additionally, we maintain that the measure appropriately accounts for disease severity identifiable in claims, as reflected in the measure's subgrouping and risk adjustment methodologies. We addressed the measure-specific feedback, regarding risk adjustment methodology, measure testing, and potential unintended consequences, in section IV.A.4.e.(2)(a)(ii) of this final rule in further detail.

After consideration of public comments, we are finalizing the *Optimal Care for Patients with Urologic Conditions MVP* as proposed in Tables A.4a and A.4b for the CY 2025 performance period/2027 MIPS payment year and future years.

A.5 Pulmonology Care MVP

In the CY 2025 PFS proposed rule (89 FR 62600 through 62603), we proposed and solicited comments on the Pulmonology MVP. The proposed Pulmonology Care MVP focuses on assessing optimal care for patients treated for a broad range of pulmonology conditions including COPD, asthma, sleep apnea, and general pulmonology. This MVP will be most applicable to clinicians who treat patients within the practice of pulmonology and sleep medicine, including nonphysician practitioners (NPPs) such as nurse practitioners, and physician assistants. The summary of the public comments received and our responses for this MVP are included immediately after Table A.5b.

Quality Measures

We proposed to include nine MIPS quality measures and one QCDR measure within the quality performance category of this MVP, which are specific to the clinical topic of pulmonology. We reviewed the MIPS quality measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine which quality measures best represent the clinical topic of this MVP.

The following quality measures provide a meaningful and comprehensive assessment of the clinical care for clinicians who specialize in pulmonology:

- Q052: Chronic Obstructive Pulmonary Disease (COPD): Spirometry Evaluation for Long-Acting Inhaled Bronchodilator Therapy: This MIPS quality measure ensures adults 18 and older diagnosed with COPD have spirometry results documented airflow obstruction confirming diagnosis and have been prescribed a long-acting bronchodilator to provide proper treatment if symptomatic.
- Q277: Sleep Apnea: Severity Assessment at Initial Diagnosis: This MIPS quality measure ensures adults diagnosed with obstructive sleep apnea have an appropriate assessment completed and documented at the time of diagnosis or measured within 2 months of initial evaluation for suspected obstructive sleep apnea.
- Q279: Sleep Apnea: Assessment of Adherence to Obstructive Sleep Apnea (OSA) Therapy: This MIPS quality measure ensures patients with a diagnosis of obstructive sleep apnea (OSA) who were prescribed an evidence-based therapy with documentation that adherence to the therapy was assessed annually.
- Q398: Optimal Asthma Control: This MIPS quality measure assesses pediatric and adult patients to ensure their asthma is well-controlled as demonstrated by one of three age-appropriate patient reported outcome tools and not at risk for exacerbation.
- ACEP25: Tobacco Use: Screening and Cessation Intervention for Patients with Asthma and COPD: This QCDR measure ensures patients with asthma or COPD seen in the emergency department receive tobacco cessation if screened positive for tobacco use.

The following broadly applicable MIPS quality measures are relevant to clinicians who specialize in pulmonology care. The measures assess for age-specific screenings, and follow-up actions for select measures, in addition to recommended vaccinations:

- Q047: Advance Care Plan: This MIPS quality measure assesses for medical record documentation of an advance care plan or surrogate decisions maker.
- Q128: Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan: This MIPS quality measure assesses patients for a BMI documented with a follow-up plan documented if their most recent documented BMI was outside of normal parameters.
- Q226: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention: This MIPS quality measure ensures patients are screened for tobacco use and if screened positive receive tobacco cessation intervention.
- Q487: Screening for Social Drivers of Health: This MIPS quality measure ensures adults are screened for food insecurity, housing instability, transportation needs, utility difficulties, and interpersonal safety.
- Q503: Gains in Patient Activation Measure (PAM®) Scores at 12 Months: This MIPS quality measure ensures capture of the patient voice and experience of care related to the patient's understanding and confidence in the clinician's ability to manage their health and be an active partner in the health care journey.

Improvement Activities

We reviewed the Improvement Activities Inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of improvement activities to include in this MVP. We proposed to include 11 improvement activities that reflect actions and processes undertaken by clinicians who specialize in pulmonology care, as well as activities that promote patient engagement and patient-centeredness, health equity, shared decision making, and care coordination. These improvement activities provide opportunities for clinicians, in collaboration with patients, to drive outcomes and improve quality of care. The following improvement activities are proposed for inclusion in this MVP:

- IA_AHE_3: Promote Use of Patient-Reported Outcome Tools
- IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols
- IA_AHE_12: Practice Improvements that Engage Community Resources to Address Drivers of Health
- IA_BE_23: Integration of patient coaching practices between visits
- IA_CC_9: Implementation of practices/processes for developing regular individual care plans
- IA_EPA_2: Use of telehealth services that expand practice access
- IA_ERP_6: COVID-19 Vaccine Achievement for Practice Staff (modified to IA_PM_26)
- IA_PCMH: Electronic submission of Patient Centered Medical Home accreditation
- IA_PM_13: Chronic care and preventative care management for empaneled patients
- IA_PM_16: Implementation of medication management practice improvements

Cost Measures

We proposed to include two MIPS cost measures within the cost performance category of this MVP, which apply to the clinical topic of pulmonology care. We reviewed the MIPS cost measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of cost measures to include in this MVP. The following cost measures provide a meaningful assessment of the clinical care for clinicians who specialize in pulmonology and align with other measures and activities within this MVP:

- Inpatient Chronic Obstructive Pulmonary Disease (COPD) Exacerbation: This MIPS episode-based cost measure assesses costs associated with inpatient treatment for an acute exacerbation of COPD. This also aligns with quality measures such as Q052: Chronic Obstructive Pulmonary Disease (COPD): Spirometry Evaluation for Long-Acting Inhaled Bronchodilator Therapy.

- **Asthma/Chronic Obstructive Pulmonary Disease (COPD):** This MIPS episode-based cost measure assesses costs associated with medical care to manage and treat asthma or COPD. This also aligns with quality measures such as Q398: Optimal Asthma Control or ACEP25: Tobacco Use: Screening and Cessation Intervention for Patients with Asthma and COPD.

Pulmonology Care MVP Tables

Tables A.5a and A.5b serve to represent the measures and activities that are finalized within the Pulmonology MVP.

The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for this MVP as proposed. One commenter recommended the inclusion of more patient-centered measures in the MVP. For example, measures vetted by the Core Quality Measures Collaborative (CQMC) with consumer input, measures of patient outcomes, patient-reported measures, as well as new approaches to the evaluation of patient experience. One commenter supported the inclusion of the Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols improvement activity in this MVP. Another commenter expressed support for the inclusion of Q277: Sleep Apnea: Severity Assessment at Initial Diagnosis and Q279: Sleep Apnea: Assessment of Adherence to Obstructive Sleep Apnea Therapy in this MVP.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter recommended this MVP be modified to be more meaningful and directly beneficial to both physicians and their patients, reflecting the real-world clinical scenarios and challenges faced in practice.

Response: We acknowledge the commenters concerns; however, the MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting which would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician’s scope of care. We understand that not all quality measures are applicable to all clinicians who would choose to report this MVP; however, this represents the foundation from which to build the most meaningful MVP addressing pulmonology care and allows for clinician choice in choosing quality measures that best represent their practice. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter recommended specialty groups be provided the opportunity to determine if the measures included are appropriate and operationally reasonable.

Response: We post MVP candidates to the QPP website for public feedback for up to a 45-day window to further engage with interested parties on MVP candidates prior to rulemaking. In addition, interested parties are welcome to submit recommended changes to an MVP on an ongoing basis through the MVP Maintenance Process. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP. We will also continue to monitor this MVP and make revisions as appropriate based upon interested party feedback and MIPS quality measure inventory changes.

Comment: A few commenters are concerned this MVP is not a viable option for allergists, noting only three quality measures are regularly utilized by allergist. The commenters recommended the addition of Quality measure Q130: Documentation of Current Medications in the Medical Record, Q331: Adult Sinusitis: Antibiotic Prescribed for Acute Viral Sinusitis (Overuse) Sinusitis, and Q332: Adult Sinusitis: Appropriate Choice of Antibiotic: Amoxicillin With or Without Clavulanate Prescribed for Patients with Acute Bacterial Sinusitis (Appropriate Use) which are applicable to allergists.

Response: We acknowledge the commenters' concerns, and we may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter recommended this MVP include at least six eCQMs. One commenter is concerned that the MVP cannot be reported solely utilizing eCQMs. Another commenter stated their belief that quality measure reporting in an MVP should be available using a combination of claims-based reporting and eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eCQMs to discuss revisions for possible implementation in futures years.

After consideration of public comments, we are finalizing the *Pulmonology MVP* as proposed in Tables A.5a and A.5b for the CY 2025 performance period/2027 MIPS payment year and future years.

A.6 Surgical Care MVP

In the CY 2025 PFS proposed rule (89 FR 62603 through 62606), we proposed and solicited comments on the Surgical Care MVP. The proposed Surgical Care MVP focuses on the clinical theme of surgery. This MVP will be most applicable to clinicians who treat patients within the surgical settings of general surgery, neurosurgery, cardiothoracic surgery, anesthesiologists, including nonphysician practitioners (NPPs) such as certified registered nurse anesthetists (CRNAs), nurse practitioners, and physician assistants. The summary of the public comments received and our responses for this MVP are included immediately after Table A.6b.

Quality Measures

We proposed to include 15 MIPS quality measures within the quality performance category of this MVP, which are specific to the clinical theme of surgery. We reviewed the MIPS quality measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine which quality measures best represent the clinical topic of this MVP.

The following quality measures provide a meaningful and comprehensive assessment of the clinical care for clinicians who specialize in surgery:

- Q164: Coronary Artery Bypass Graft (CABG): Prolonged Intubation: This MIPS quality measure identifies patients who undergo an isolated CABG and require intubation > 24 hours following exit from the operating room.
- Q167: Coronary Artery Bypass Graft (CABG): Postoperative Renal Failure: This MIPS quality measure assesses patients for postoperative renal failure or who require dialysis after CABG.
- Q168: Coronary Artery Bypass Graft (CABG): Surgical Re-Exploration: This MIPS quality measure identifies patients who return to the operating room for surgical re-exploration following an isolated CABG surgery during the current hospitalization.
- Q264: Sentinel Lymph Node Biopsy for Invasive Breast Cancer: This MIPS quality measure assesses the percentage of patients with a diagnosis of primary invasive breast cancer who undergo a sentinel lymph node procedure.
- Q354: Anastomotic Leak Intervention: This MIPS quality measure evaluates for anastomotic leak intervention following gastric bypass or colectomy surgery.

- Q355: Unplanned Reoperation within the 30-Day Postoperative Period: This MIPS quality measure evaluates for an unplanned reoperation within 30 days of a denominator eligible procedure.
- Q357: Surgical Site Infection (SSI): This MIPS quality measure evaluates for SSI within 30 days of a denominator eligible procedure.
- Q358: Patient-Centered Surgical Risk Assessment and Communication: This MIPS quality measure ensures a personalized surgical risk assessment is completed on each patient using a validated risk calculator or multi-institutional clinical data prior to the surgery along with discussion of the identified risks with the surgeon.
- Q445: Risk-Adjusted Operative Mortality for Coronary Artery Bypass Graft (CABG): This MIPS quality measure assesses patients undergoing isolated CABG for quality outcomes by identifying the percentage of patients who die, including all deaths occurring during CABG hospitalization and deaths occurring after discharge up to 30 days post CABG surgery.
- Q459: Back Pain After Lumbar Surgery: This MIPS quality measure evaluates patients for a decrease in back pain post lumbar surgery based upon predetermined benchmarks.
- Q461: Leg Pain After Lumbar Surgery: This MIPS quality measure evaluates patients for a decrease in leg pain post lumbar surgery based upon predetermined benchmarks.
- Q471: Functional Status After Lumbar Surgery: This MIPS quality measure evaluates patients for an increase in functional status post lumbar surgery based upon predetermined benchmarks.

The following broadly applicable MIPS quality measures are relevant to clinicians who treat patients in surgical settings. The measures assess for age-specific screenings, and follow-up actions for select measures, in addition to recommended vaccinations:

- Q047: Advance Care Plan: This MIPS quality measure assesses for medical record documentation of an advance care plan or surrogate decisions maker.
- Q226: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention: This MIPS quality measure ensures patients are screened for tobacco use and if screened positive receive tobacco cessation intervention.
- Q487: Screening for Social Drivers of Health: This MIPS quality measure ensures adults are screened for food insecurity, housing instability, transportation needs, utility difficulties, and interpersonal safety.

Improvement Activities

We reviewed the Improvement Activities Inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of improvement activities to include in this MVP. We proposed to include 12 improvement activities that reflect actions and processes undertaken by surgical care clinicians, as well as activities that promote patient engagement and patient-centeredness, health equity, shared decision making, and care coordination. These improvement activities provide opportunities for clinicians, in collaboration with patients, to drive outcomes and improve quality of care. The following improvement activities are proposed for inclusion in this MVP:

- IA_AHE_3: Promote Use of Patient-Reported Outcome Tools
- IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols
- IA_BE_12: Use evidence-based decision aids to support shared decision-making
- IA_CC_15: PSH Care Coordination
- IA_CC_17: Patient Navigator Program
- IA_CC_18: Relationship-Centered Communication
- IA_ERP_6: COVID-19 Vaccine Achievement for Practice Staff (modified to IA_PM_26)
- IA_PCMH: Electronic submission of Patient Centered Medical Home accreditation
- IA_PM_11: Regular review practices in place on targeted patient population needs
- IA_PSPA_7: Use of QCDR data for ongoing practice assessment and improvements
- IA_PSPA_8: Use of Patient Safety Tools

Cost Measures

We proposed to include six MIPS cost measures within the cost performance category of this MVP, which apply to the clinical theme of surgical care. We reviewed the MIPS cost measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of cost measures to include in this MVP. The following cost measures provide a meaningful assessment of the clinical care for clinicians who specialize in surgical care and align with other measures and activities within this MVP:

- Colon and Rectal Resection: This MIPS episode-based cost measure assesses costs associated with colon or rectal resections for either benign or malignant indications.
- Femoral or Inguinal Hernia Repair: This MIPS episode-based cost measure assesses costs associated with surgical procedures to repair a femoral or inguinal hernia.
- Lumbar Spine Fusion for Degenerative Disease, 1-3 Levels: This MIPS episode-based cost measure assesses costs associated with surgery for lumbar spine fusion. This also aligns with quality measures such as Q471: Functional Status After Lumbar Surgery or Q461: Leg Pain After Lumbar Surgery.
- Lumpectomy, Partial Mastectomy, Simple Mastectomy: This MIPS episode-based cost measure assesses costs associated with partial or total mastectomy for breast cancer.

- Medicare Spending Per Beneficiary (MSPB) Clinician: This MIPS cost measure applies to clinicians providing care in inpatient hospitals, including those who treat patients within the surgical settings of general surgery, neurosurgery, and cardiothoracic surgery.
- Non-Emergent Coronary Artery Bypass Graft (CABG): This MIPS episode-based cost measure assesses costs associated with CABG. This also aligns with quality measures such as Q164: Coronary Artery Bypass Graft (CABG): Prolonged Intubation or Q168: Coronary Artery Bypass Graft (CABG): Surgical Re-Exploration.

Surgical Care MVP Tables

Tables A.6a and A.6b serve to represent the measures and activities that are finalized within the Surgical Care MVP.

The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for this MVP as proposed. One commenter recommended the inclusion of more patient-centered measures in the MVP. For example, measures vetted by the Core Quality Measures Collaborative (CQMC) with consumer input, measures of patient outcomes, patient-reported measures, as well as new approaches to the evaluation of patient experience. One commenter supported the inclusion of the Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols improvement activity in this MVP.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: Several commenters expressed opposition to this MVP as they believed the MVP is too broad to provide a meaningful pathway for specialists to be measured and meet the stated MVP goals as they relate to vascular surgeons and other surgical specialists. A couple of commenters believed the MVP is limiting for many surgical specialties. Other commenters believed the MVP includes measures across distinct populations without consideration of how these populations are treated in practice and does not allow for significant comparison or quality improvement. Another commenter believed there's a lack of benchmarks for certain measures, such as those quality measures related to CABG, which they feel may discourage meaningful participation and hinder the MVP's effectiveness. One commenter recommended the development of a Geriatric Surgery MVP instead of this MVP. The commenter believed a Geriatric Surgery MVP could align physician reporting with the Age Friendly Hospital measure that will be required for hospital reporting under the Hospital Inpatient Quality Reporting (IQR) program in 2025. They suggested that an MVP on this topic could focus on the unique needs of older adults as they move through the phases of surgical care. If aligned with the Hospital IQR program measure, hospitals could show their commitment to improving care for older adults, while also aligning metrics to achieve attestations and track performance for multiple programs. One commenter questioned combining measures from disparate surgical specialties that have little to no overlap in team-based care. The commenter stated the inclusion of measures relevant to spine surgery, cardiothoracic surgery, breast surgery, and general surgery appears arbitrary and disconnected from actual clinical practice.

Response: This MVP was intentionally made broad to allow for multiple surgical specialties the option of reporting an MVP as we move towards the sunset of traditional MIPS. While we understand this MVP covers multiple surgical specialties, this is due to limited measure inventory which does not allow for the creation of individual robust, meaningful MVPs for each surgical specialty. Clinicians who choose to report this MVP would still report data based upon the measures that are most applicable to their scope of care, allowing for an alternate option to traditional MIPS especially when choosing subgroup reporting with MVPs.

We acknowledge the commenters' concerns regarding benchmarks. While we endeavor to include measures that allow for maximum points, we want to ensure important aspects of care within the MVP clinical topic are represented. While we recognize that some of the quality measures don't have sufficient adoption to create a benchmark under traditional MIPS, we expect the move to MVP reporting, including subgroup reporting, will drive adoption of those measures as CABG is one of the most commonly performed procedures on Medicare beneficiaries.

We acknowledge the recommendation for a geriatric surgery MVP. Due to nuances between different CMS programs including Hospital IQR Program and MIPS, full alignment is not always possible, however, we continue to strive for alignment as feasible. Currently, the MIPS quality measure inventory does not contain surgical measures that are specific to the geriatric population. We encourage the commenter to submit quality measures to the Annual Call for Quality Measures for potential inclusion in future years. We will continue to monitor this MVP and make revisions as appropriate based upon interested party feedback and MIPS quality measure inventory changes.

Comment: One commenter requested clarification on why this MVP focuses on specific types of surgery but excludes others for which MIPS measures currently exist. For example, the commenter questioned why measures related to hip/knee surgery are not included in this MVP.

Response: We thank the commenter for their feedback. This MVP was intentionally made broad to allow for surgical specialties the option of reporting an MVP. While we understand this MVP covers multiple surgical specialties, the intent was to not overlap with currently available MVPs, such as the Improving Care for Lower Extremity Joint Repair MVP. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: A couple of commenters expressed frustration regarding the construction of this MVP. They stated their belief that affected surgical specialties were not included in developing the MVP to assess the appropriateness of this strategy. One commenter recommended specialty groups be provided the opportunity to determine if the measures included in the MVP are appropriate and operationally reasonable.

Response: We post MVP candidates to the QPP website for public feedback for up to a 45-day window to further engage with interested parties on MVP candidates prior to rulemaking. In addition, interested parties are welcome to submit recommended changes to an MVP on an ongoing basis through the MVP Maintenance Process. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP. We will also continue to monitor this MVP and make revisions as appropriate based upon interested party feedback and MIPS quality measure inventory changes.

Comment: One commenter recommended moving the CABG measures to the Advancing Care for Heart Disease MVP for this MVP to make more clinical sense and be more representative of team-based care.

Response: We thank the commenters for their general feedback on the CABG measures. We maintain that the Non-Emergent CABG episode-based cost measure is appropriate for use in the Surgical Care MVP, as it assesses costs associated with cardiothoracic surgery and aligns with Q164: Coronary Artery Bypass Graft (CABG); Prolonged Intubation, Q167: Coronary Artery Bypass Graft (CABG); Postoperative Renal Failure, and Q168: Coronary Artery Bypass Graft (CABG); Surgical Re-Exploration. We may consider the inclusion of additional measures and improvement activities in this and other MVPs through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter recommended refinements to the MVP to make it more accessible to CRNAs or to encourage subgroup reporting. The commenter noted that only one of the quality measures, Q164: Coronary Artery Bypass Graft: Prolonged Intubation, is directly attributable to CRNAs.

Response: We acknowledge the commenters' concerns. While this MVP focuses on the clinical theme of promoting quality care provided by surgeons, CRNAs and other applicable surgical clinicians play a vital role and positively influence the outcomes of several other quality measures within this MVP. Recognizing the MIPS quality measures inventory contains a limited number of measures that are specific to CRNAs, the Patient Safety and Support of Positive Experiences with Anesthesia MVP may be more in alignment with the scope of care provided by CRNAs. We would encourage the commenter to submit quality measures to the Annual Call for Quality Measures for potential inclusion in future years. We will continue to monitor this MVP and make revisions as appropriate based upon interested party feedback and MIPS quality measure inventory changes.

Comment: One commenter is opposed to the use of Q459: Back Pain After Lumbar Surgery in this MVP since improving back pain is typically not the primary goal of lumbar fusion surgery.

Response: We acknowledge the commenters' concerns. Low back pain is a common, disabling symptom driving patients to seek medical care. The benchmark of change (5.0) utilized within the measure was derived from years of data obtained by the measure steward. While we recognize that spine surgical interventions rarely eliminate back pain, assessing the percentage of patients achieving an "acceptable symptom state" may be an indicator of surgical success.

Comment: A couple of commenters believed there are limitations to measures Q355: Unplanned Reoperation within the 30-Day Postoperative Period and Q357: Surgical Site Infection. Although the title and description of these two measures seem to suggest that they are broadly applicable across surgical specialties, the denominator codes are almost exclusively focused on general surgery.

Response: We acknowledge the commenters' concerns and appreciate the feedback. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.

Comment: One commenter believed there are limitations related to the spine measures included in this MVP. For example, for Q471: Functional Status After Lumbar Surgery, the only acceptable functional assessment tool that can be used to satisfy the measure is the Oswestry Disability Index. The commenter stated their belief that there are more appropriate functional outcome measures from tools such as PROMIS® (Patient-Reported Outcomes Measurement Information System) that should be included. The commenter was also concerned that all three spine surgery measures included in this MVP continue to lack a benchmark.

Response: We encourage the commenter to reach out to measure developers/stewards to develop additional measures utilizing the PROMIS tool for submission to the Annual Call for Quality Measures for possible future implementation. We may consider the inclusion of QCDR measures that meet the inclusion criteria and address a measurement gap through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP. Many of these measures currently lack a benchmark due to substantive changes made in previous years with the goal of creating a more robust set of measures leading to benchmark creation.

Comment: One commenter recommended the removal of IA_CC_15: PSH Care Coordination as they believed that the improvement activity is not multidisciplinary and does not necessarily involve CRNAs.

Response: We appreciate the feedback received. Upon reflection and to allow for clinician choice in choosing improvement activities that best represent their practice, we are going to retain this activity in this MVP.

Comment: One commenter recommended this MVP include at least six eCQMs. One commenter is concerned that the MVP cannot be reported solely utilizing eCQMs. Another commenter stated their belief that quality measure reporting in an MVP should be available using a combination of claims-based reporting and eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eCQMs to discuss revisions for possible implementation in future years.

Comment: One commenter expressed uncertainty about how the quality measures related to Coronary Artery Bypass Grafting (CABG) surgery align with the corresponding cost measure for non-emergent CABG procedures. The commenter stated that, while the MVP's quality measures primarily focus on clinical outcomes, they indirectly influence the cost-effectiveness of CABG surgery. The commenter suggested that, however, clinical outcomes alone may not provide a comprehensive picture of resource utilization or costs, as factors like hospital length of stay and equipment usage significantly impact costs but may not be adequately captured by these measures. The commenter stated that, as with any of the cost measures, the focus on cost containment may inadvertently incentivize clinicians to limit necessary care or select patients based on cost considerations, potentially compromising patient outcomes or access to care. A couple of commenters are concerned that there is a lack of internal consistency between the quality and cost measures included in this MVP related to lumbar fusion. For example, quality measures Q461: Leg Pain After Lumbar Surgery, Q471: Functional Status After Lumbar Surgery and Q459: Back Pain After Lumbar Surgery each capture lumbar fusion or discectomy/laminectomy without fusion. On the other hand, the cost measure, Lumbar Spine Fusion for Degenerative Disease, 1-3 Levels, only focuses on fusions. Furthermore, the lumbar fusion quality measures are evaluated at one-year post-operation, whereas the lumbar fusion acute episode cost measure ends at 90 days post-operation. As a result, the commenter stated their belief is that these quality and cost measures are misaligned, do not evaluate the same patient populations in the same manner, and will not result in accurate assessments of value. The commenter suggested this disparity creates an incentive to delay care, such as physical therapy, until after the acute cost measurement episode has ended.

Response: We agree with the commenters that it is important to consider quality performance alongside cost performance. The quality and cost measures included in the Surgical Care MVP are aligned to focus on the same clinical subgroupings, such as cardiothoracic and neurosurgery, as well as to cover similar patient populations. Both the Non-Emergent CABG and the Lumbar Spine Fusion for Degenerative Disease cost measures use similar service and diagnoses codes to their quality measure counterparts to identify the patient populations. The MVP also includes additional quality measures and improvement activities to collectively assess the overall value of surgical care. Additionally, the quality measures assess clinical outcomes which utilize different timeline criteria, based upon guidelines and best practices, for the purposes of assessing the quality action.

We also disagree with commenters that the inclusion of cost measures in the MVP do not adequately capture costs of resource utilization and incentivize care stinting. Cost measures encompass costs of all clinically related services furnished during an episode, including hospital stays, treatment and diagnostic services, ancillary items, services directly related to treatment, and those furnished as a consequence of care (for example, complications, readmissions, unplanned care, and emergency department visits). Cost measures aim to promote care coordination and can capture clinicians' cost savings through reduction of poor patient outcomes associated with higher-than-expected episode costs, such as potentially avoidable hospitalizations or complications.

After consideration of public comments, we are finalizing the *Surgical Care MVP* as proposed in Tables A.6a and A.6b for the CY 2025 performance period/2027 MIPS payment year and future years.

Group B: Modifications to Previously Finalized MVPs for the CY 2025 Performance Period/2027 MIPS Payment Year and Future Years

B.1: Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP

In the CY 2025 PFS proposed rule (89 FR 62607 through 62609), we proposed and solicited comments on the previously finalized Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP. Tables B.1a and B.1b represent the measures and activities that were finalized within the Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP in (88 FR 88029 through 80032) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.1b.

Quality Measures

We proposed to modify the previously finalized Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP to remove one MIPS quality measure as it is a process measure and has become standard of care, based upon MIPS performance data showing continued high performance.

- Q254: Ultrasound Determination of Pregnancy Location for Pregnant Patients with Abdominal Pain

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁴⁹, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; remove the weights associated with the improvement activities contained in this MVP; and remove one improvement activity being proposed for removal from MIPS:

- IA_CC_2: Implementation of improvements that contribute to more timely communication of test results

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP Tables

Tables B.1a and B.1b serve to represent the measures and activities that are finalized within the Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP.

Symbol Key:

Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures

Single asterisk (*): existing measures and improvement activities with revisions

Double asterisk (**): measures and improvement activities only available when included in an MVP

Single exclamation point (!): high priority measures

Double exclamation point (!!): outcome measures

Tilde (~): measures and improvement activities that include a health equity component

¹¹⁴⁹ See *Improvement Activity Policy Update and Global Inclusion of an Improvement Activity*.

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP.

Response: We thank the commenters for their support.

Comment: One commenter questioned why the Emergency Medicine MVP does not align with the Emergency Medicine specialty set.

Response: As we move to sunset traditional MIPS, MVPs are not intended to be duplicative of specialty measure sets but rather create a connected set of quality measures, cost measures and improvement activities to promote quality care within Emergency Medicine.

Comment: One commenter expressed concern that the MVP does not offer a broad enough inventory of CQMs to reflect the diversity of emergency medicine patient populations and the considerable expense of investing in a Qualified Clinical Data Registry (QCDR). The commenter recommended the addition of the following CQMs to the MVP; Q066: Appropriate Testing for Pharyngitis, Q187: Stroke and Stroke Rehabilitation: Thrombolytic Therapy, and Q332: Adult Sinusitis: Appropriate Choice of Antibiotic: Amoxicillin With or Without Clavulanate Prescribed for Patients with Acute Bacterial Sinusitis.

Response: We may consider the inclusion of additional quality measures through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter recommended this MVP include at least six eCQMs. One commenter is concerned that the MVP cannot be reported solely utilizing eCQMs. Another commenter stated their belief that quality measure reporting in an MVP should be available using a combination of claims-based reporting and eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eCQMs to discuss revisions for possible implementation in future years.

After consideration of public comments, we are finalizing the *Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP* with modifications in Table B.1a and as proposed in Table B.1b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details. Based on comments received, we are delaying the removal of IA_CC_2: Implementation of improvements that contribute to more timely communication of test results. See Appendix 2, Table C for additional details.

B.2: Advancing Cancer Care MVP

In the CY 2025 PFS proposed rule (89 FR 62609 through 62613), we proposed and solicited comments on the previously finalized Advancing Cancer Care MVP. Tables B.2a and B.2b represent the measures and activities that were finalized within the Advancing Cancer Care MVP in (88 FR 80008 through 80011) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.2b.

Quality Measures

We proposed to modify the previously finalized Advancing Cancer Care MVP within the quality performance category of this MVP to include six additional MIPS quality measures and one additional QCDR measure that address appropriate cancer care treatment. We reviewed the MIPS quality measure inventory and considered feedback received during the 2025 MVP maintenance period to determine which quality measures to include in this MVP.

The following quality measures proposed within this MVP provide a meaningful and comprehensive assessment of the clinical care for clinicians providing care to patients with cancer:

- Q102: Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low Risk Prostate Cancer Patients: This MIPS quality measure assesses overuse of bone scans for patients with prostate cancer with low incidence of recurrence receiving treatment.
- Q506: Positive PD-L1 Biomarker Expression Test Result Prior to First-Line Immune Checkpoint Inhibitor Therapy: This proposed MIPS quality measure ensures timely biomarker testing for patients with a diagnosis of metastatic non-small cell lung cancer or squamous cell carcinoma of head and neck on first-line immune checkpoint inhibitor (ICI) therapy.
- Q507: Appropriate Germline Testing for Ovarian Cancer Patients: This proposed MIPS quality measure assesses patients with a diagnosed with epithelial ovarian, fallopian tube, or primary peritoneal cancer for completion germline testing within 6 months of diagnosis.
- TBD: Patient-Reported Pain Interference Following Chemotherapy among Adults with Breast Cancer: This proposed MIPS quality measure assesses pain interference following chemotherapy administered with curative intent to adult patients with breast cancer.
- TBD: Patient-Reported Fatigue Following Chemotherapy among Adults with Breast Cancer: This proposed MIPS quality measure assesses fatigue following chemotherapy administered with curative intent to adult patients with breast cancer.
- PIMSH17: Oncology: Utilization of Prophylactic G-CSF for Cancer Patients Receiving Low-Risk Chemotherapy (inverse measure): The intent of this QCDR measure is to assess prophylactic use of granulocyte colony stimulating factor (G-CSF) when it is not indicated for low-risk chemotherapy and is not restricted to metastatic colorectal cancer.

In addition, we proposed the following broadly applicable MIPS quality measure, which is relevant to patients receiving cancer care and their experience of their health care treatment journey:

- Q495: Ambulatory Palliative Care Patients' Experience of Feeling Heard and Understood: This MIPS quality measure ensures palliative care clinicians and/or teams are actively engaged to ensure patients are understood in a significant and empowering way.

We proposed to modify the previously finalized Advancing Cancer Care MVP to remove two MIPS quality measures as they are duplicative in concept to current MIPS quality measures and are being proposed for removal from MIPS:

- Q144: Oncology: Medical and Radiation - Plan of Care for Pain
- Q452: Patients with Metastatic Colorectal Cancer and RAS (KRAS or NRAS) Gene Mutation Spared Treatment with Anti-epidermal Growth Factor Receptor (EGFR) Monoclonal Antibodies

We are also proposing to remove one QCDR measure which will be replaced by PIMSH17: Oncology: Utilization of Prophylactic G-CSF for Cancer Patients Receiving Low-Risk Chemotherapy (inverse measure), which has a broader denominator and is not restricted to metastatic colorectal cancer.

- PIMSH2: Oncology: Utilization of GCSF in Metastatic Colorectal Cancer

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁵⁰, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; and add an additional improvement activity that addresses maintenance requests from the public, as well as addresses priority areas including food insecurity and the incorporation of patient voices into health care decision making:

- IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols

For the reasons stated in the introduction of this appendix, we proposed the following: remove the weights associated with the improvement activities contained in this MVP; and remove three improvement activities being proposed for removal from MIPS:

- IA_CC_1: Implementation of Use of Specialist Reports Back to Referring Clinician or Group to Close Referral Loop
- IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record
- IA_ERP_4: Implementation of a Personal Protective Equipment (PPE) Plan

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Cost Measures

We proposed to add one MIPS cost measure within the cost performance category of this MVP, which applies to the clinical topic of cancer care. We reviewed the MIPS cost measure inventory and considered feedback received from interested parties through the MVP maintenance process to determine the cost measures to include in this MVP. The following cost measure provides a meaningful assessment of the clinical care for clinicians who specialize in cancer care and aligns with other measures and activities included within this MVP:

- Prostate Cancer: This proposed MIPS episode-based cost measure will assess costs associated with prostate cancer. This also aligns with quality measures such as Q102: Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low Risk Prostate Cancer Patients.

Advancing Cancer Care MVP Tables

Tables B.2a and B.2b serve to represent the measures and activities that are finalized within the Advancing Cancer Care MVP.

Symbol Key:

- Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP. One commenter appreciated the focus on screening measures in this MVP. One commenter supported the addition of the Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols improvement activity in this MVP. A couple of commenters supported the inclusion of the Q495: Ambulatory Palliative Care Patients’ Experience of Feeling Heard and Understood measure in this MVP. One commenter supported the inclusion of Q102: Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low Risk Prostate Cancer Patients. One commenter expressed support for retaining the following quality measures: Q450: Appropriate Treatment for Patients with Stage I (T1c) – III HER2 Positive Breast Cancer, Q451: RAS (KRAS and NRAS) Gene Mutation Testing Performed for Patients with Metastatic Colorectal Cancer who receive Anti-epidermal Growth Factor Receptor (EGFR) Monoclonal Antibody Therapy, and PIMSH13: Oncology: Mutation Testing for Stage IV Lung Cancer Completed Prior to Start of Targeted Therapy in this MVP. One commenter expressed support for the addition of the following new MIPS quality measures: Positive PD-L1 Biomarker Expression Test Result Prior to First-Line Immune Checkpoint Inhibitor Therapy and Appropriate Germline Testing for Ovarian Cancer Patients in this MVP. A couple of commenters supported the removal of the improvement activity weights from all activities and the updated requirement for MVP reporting requiring attestation to only one improvement activity.

One commenter suggested Q112: Breast Cancer, Q309 Cervical Cancer, and Q226 Preventative Care and Screening for Tobacco Care will be better for this MVP than the proposed new quality measure additions. They believed that these measures would support reporting of the MVP by both radiation oncology and medical oncology. A couple of commenters encouraged expanding this MVP to capture non-patient-facing clinicians who are integral to cancer care. Other commenters supported the removal of PIMSH2: Oncology: Utilization of GCSF in Metastatic Colorectal Cancer and replacing it with PIMSH17: Oncology: Utilization of Prophylactic GCSF for Cancer Patients Receiving Low-Risk Chemotherapy (inverse measure), which has a broader denominator and is not restricted to metastatic colorectal cancer. A couple of commenters recommended the inclusion of PIMSH15 and PIMSH16 to this MVP. One commenter recommended the inclusion of PIMSH4. One commenter encouraged expanding this MVP to capture non-patient-facing clinicians who are integral to cancer care.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on

an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter believed this MVP fails to recognize the complexity of cancer care that frequently involves the services of a surgical oncologist, a medical oncologist and a radiation oncologist. Another commenter noted the MVP is predominantly focused on medical oncology and would not be meaningful for radiation oncologists.

Response: We recognize the three main areas of oncology care and work to ensure the MVPs are broad to allow for comprehensive reporting within the MVP topic. We include measures that represent different aspects of care; however, we are limited to the current MIPS quality measure inventory and encourage interested parties to develop quality measures pertinent to their scope of care for potential consideration of implementation in MIPS. We understand that not all quality measures are applicable to all clinicians who would choose to report this MVP; however, this represents the foundation from which to build the most meaningful MVP addressing oncology care and allows for clinician choice in choosing quality measures that best represent their practice.

Comment: A few commenters opposed the removal of Q144: Oncology: Medical and Radiation – Plan of Care for Pain from the MVP. They asserted that this measure is not duplicative of, but rather paired with Q143: Oncology: Medical and Radiation – Pain Intensity Quantified and that the measures should be implemented sequentially to achieve a comprehensive clinical quality outcome, with Q143 confirming that the patient's pain was evaluated and Q144 validating that a patient care plan for pain was developed based on that assessment. They stated that the intent is for applicable clinicians to report on both measures as a unit, while resulting in individual measure scores.

Response: Based on comments received, Q144 will be maintained in MIPS therefore it will be maintained in this MVP.

Comment: A couple of commenters believed the quality measures in this MVP should align with the measures included in the “oncology/hematology specialty set”.

Response: As we move towards sunseting traditional MIPS, MVPs are not intended to be duplicative of specialty measure sets but rather create a connected set of quality measures, cost measures and improvement activities to promote quality care for cancer patients.

Comment: One commenter recommended this MVP include at least six eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eCQMs to discuss revisions for possible implementation in futures years.

Comment: A couple of commenters opposed the addition of the new, proposed Prostate Cancer cost measure to this MVP. The commenters stated that they do not believe the measure accurately reflects appropriate and expected cost variation based on disease severity and patient needs and may, in fact, create unintended disincentives that would limit provision of appropriate, high-quality care.

Response: The Prostate Cancer episode-based cost measure is appropriate for use in this MVP, as it assesses costs associated with prostate cancer and aligns with Q102: Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low Risk Prostate Cancer Patients. Additionally, we maintain that the measure appropriately accounts for disease severity identifiable in claims, as reflected in the measure's subgrouping and risk adjustment methodologies. We have addressed this measure-specific feedback under section IV.A.4.e.(2)(a)(ii) of this final rule in further detail.

Comment: A couple of commenters advocated for the removal of the Total Per Capita Cost (TPCC) measure from the MVP. One commenter suggested that, if we do not remove the TPCC measure from MIPS, then we should at a minimum remove the TPCC measure from all MVPs that include episode-based cost measures.

Response: The Total Per Capita Cost (TPCC) measure is appropriate for use in this MVP. We refer readers to the CY 2022 PFS proposed rule (86 FR 39881 through 39895), CY 2022 PFS final rule (86 FR 66001), CY 2023 PFS proposed rule (87 FR 46814 through 46828), and CY 2023 PFS final rule (87 FR 70038) for more information about why it is appropriate to include the TPCC measure in MVPs. We may consider the addition or removal of cost measures through future MVP maintenance and rulemaking processes. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

After consideration of public comments, we are finalizing the *Advancing Cancer Care MVP* with modifications in Table B.2a and as proposed in Table B.2b for the CY 2025 performance period/2027 MIPS payment year and future years. The following measures are not being finalized in MIPS and therefore are not being finalized in this MVP, TBD: Patient-Reported Pain

Interference Following Chemotherapy among Adults with Breast Cancer and TBD: Patient-Reported Fatigue Following Chemotherapy among Adults with Breast Cancer. See Appendix 1, Table B.27a for additional details. Based on comments received, we are not finalizing the removal of quality measure Q144: Oncology: Medical and Radiation - Plan of Care for Pain. The measure steward is evaluating respecifying measures Q143: Oncology: Medical and Radiation – Pain Intensity Quantified and Q144: Oncology: Medical and Radiation – Plan of Care for Pain into a single, combined measure and requested that both measures be retained at this time. See Appendix 1, Table C.3 for additional details. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details. We are delaying the removal of IA_CC_1: Implementation of Use of Specialist Reports Back to Referring Clinician or Group to Close Referral Loop. See Appendix 2, Table C for additional details.

B.3: Advancing Care for Heart Disease MVP

In the CY 2025 PFS proposed rule (89 FR 62613 through 62616), we proposed and solicited comments on the previously finalized Advancing Care for Heart Disease MVP. Tables B.3a and B.3b represent the measures and activities that were finalized within the Advancing Care for Heart Disease MVP in (88 FR 80022 through 80025) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.3b.

Quality Measures

We proposed to modify the previously finalized Advancing Care for Heart Disease MVP within the quality performance category of this MVP to include one additional broadly applicable MIPS quality measure relevant to patients receiving care for heart disease. We reviewed the quality measure inventory and considered feedback received during the 2025 MVP maintenance period to determine which quality measures to include in this MVP.

- **Q495: Ambulatory Palliative Care Patients’ Experience of Feeling Heard and Understood:** This MIPS quality measure ensures palliative care clinicians and/or teams empathize to ensure patients are understood in a significant and empowering way.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁵¹, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; and remove the weights associated with the improvement activities contained in this MVP.

Cost Measures

We did not propose to modify the MIPS cost measures included within the cost performance category of this previously finalized Advancing Care for Heart Disease MVP by proposing to add or remove cost measures from the MVP. However, we proposed to modify the ST-Elevation Myocardial Infarction (STEMI) with Percutaneous Coronary Intervention (PCI) cost measure, which included a proposed measure title update to Inpatient (IP) Percutaneous Coronary Intervention (PCI). Please see section IV.A.4.e.(2)(a)(iii) of this final rule for all finalized revisions to this cost measure.

Advancing Care for Heart Disease MVP Tables

Tables B.3a and B.3b serve to represent the measures and activities that are finalized within the Advancing Care for Heart Disease MVP.

Symbol Key:

- Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures
- Single asterisk (*): existing measures and improvement activities with revisions
- Double asterisk (**): measures and improvement activities only available when included in an MVP
- Single exclamation point (!): high priority measures
- Double exclamation point (!!): outcome measures
- Tilde (~): measures and improvement activities that include a health equity component

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP. One commenter supported the inclusion of IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols improvement activity in this MVP. Another commenter supported the inclusion of the Q495: Ambulatory Palliative Care Patients’ Experience of Feeling Heard and Understood measure in this MVP. One commenter recommended Q438: Statin Therapy for the Prevention and Treatment of Cardiovascular Disease be added to this MVP. The commenter also recommended the inclusion of the new improvement activity for clinicians to assess and manage patients at risk of ASCVD. Another commenter recommended the inclusion of the newly proposed Save a Million Hearts: Standardization of Approach to Screening and Treatment for Cardiovascular Disease Risk improvement activity.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter was concerned with the inclusion of Q495: Ambulatory Palliative Care Patients’ Experience of Feeling Heard and Understood noting the measure is not the best fit for interventional cardiologists attempting to report this MVP.

Response: The MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting which would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician’s scope of care. We understand that not all quality measures are applicable to all clinicians who would choose to report this MVP; however, this represents the foundation from which to build the most meaningful MVP addressing cardiology care and allows for clinician choice in choosing quality measures that best represent their practice.

Comment: One commenter suggested that, if we do not remove the TPCC measure from MIPS, then we should at a minimum remove the TPCC measure from all MVPs that include episode-based cost measures.

Response: The Total Per Capita Cost (TPCC) measure is appropriate for use in this MVP. We refer readers to the CY 2022 PFS proposed rule (86 FR 39881 through 39895), CY 2022 PFS final rule (86 FR 66001), CY 2023 PFS proposed rule (87 FR 46814 through 46828), and CY 2023 PFS final rule (87 FR 70038) for more information about why it is appropriate to include the TPCC measure in MVPs. We may consider the addition or removal of cost measures through future MVP maintenance and rulemaking processes. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

After consideration of public comments, we are finalizing the *Advancing Care for Heart Disease MVP* as proposed in Tables B.3a and B.3b for the CY 2025 performance period/2027 MIPS payment year and future years.

B.4: Advancing Rheumatology Patient Care MVP

In the CY 2025 PFS proposed rule (89 FR 62616 through 62619), we proposed and solicited comments on the previously finalized Advancing Rheumatology Patient Care MVP. Tables B.4a and B.4b represent the measures and activities that were finalized within the Advancing Rheumatology Patient Care MVP in (88 FR 80026 through 80029) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.4b.

Quality Measures

We proposed to modify the previously finalized Advancing Rheumatology Patient Care MVP within the quality performance category of this MVP to include one additional MIPS quality measure and two QCDR measures that are relevant to patients receiving rheumatology care. We reviewed the MIPS quality measure inventory and considered feedback received during the 2025 MVP maintenance period to determine which quality measures to include in this MVP.

The following quality measures proposed within this MVP provide address appropriate clinical care for patients with rheumatological conditions:

- Q039: Screening for Osteoporosis for Women Aged 65-85 Years of Age: This MIPS quality measure assesses women who have ever received a dual-energy x-ray absorptiometry (DXA) test to evaluate for the disease osteoporosis.
- UREQA2: Ankylosing Spondylitis: Appropriate Pharmacologic Therapy: This QCDR measure assesses patients newly diagnosed with ankylosing spondylitis for appropriate pharmacologic therapy by ensuring a course of NSAIDs is prescribed before initiation of biologics during the first six months of treatment.
- UREQA9: Screening for Osteoporosis for Men Aged 70 Years and Older: This QCDR measure identifies male patients who have ever had a central dual-energy X-ray absorptiometry (DXA) to screen for osteoporosis to identify osteoporotic risk for fracture.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁵², we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; remove the weights associated with the improvement activities contained in this MVP; and remove one improvement activities being proposed for removal from MIPS:

- IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Cost Measures

We proposed to add one MIPS cost measure within the cost performance category of this MVP, which applies to the clinical topic of rheumatology care. We reviewed the MIPS cost measure inventory and considered feedback received from interested parties through the MVP maintenance process to determine the cost measures to include in this MVP. The following cost measure provides a meaningful assessment of the clinical care for clinicians who specialize in rheumatology care and aligns with the other measures and activities included within this MVP:

- Rheumatoid Arthritis: This proposed MIPS episode-based cost measure will assess costs associated with medical care to manage and treat rheumatoid arthritis. This also aligns with quality measures such as Q177: Rheumatoid Arthritis (RA): Periodic Assessment of Disease Activity or Q178: Rheumatoid Arthritis (RA): Functional Status Assessment.

¹¹⁵² See *MVP Development: Improvement Activity Policy Update and Global Inclusion of an Improvement Activity*.

Advancing Rheumatology Patient Care MVP Tables

Tables B.4a and B.4b serve to represent the measures and activities that are finalized within the Advancing Rheumatology Patient Care MVP.

Symbol Key:

- Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures
- Caret symbol (^): new proposed measures and improvement activities
- Single asterisk (*): existing measures and improvement activities with revisions
- Double asterisk (**): measures and improvement activities only available when included in an MVP
- Single exclamation point (!): high priority measures
- Double exclamation point (!!): outcome measures
- Tilde (~): measures and improvement activities that include a health equity component

TABLE B.4a: Advancing Rheumatology Patient Care MVP Measures and Improvement Activities

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP. One commenter supported the inclusion of Q493: Adult Immunization Status measure in MVPs with a broad clinical reach such as this MVP. Another commenter supported the addition of the following quality measures: Q039: Screening for Osteoporosis for Women Aged 65-85 Years of Age, UREQA2: Ankylosing Spondylitis: Appropriate Pharmacologic Therapy, and UREQA9: Screening for Osteoporosis for Men Aged 70 Years and Older.

Response: We thank the commenters for their support.

Comment: One commenter recommended this MVP include at least six eCQMs. One commenter is concerned that the MVP cannot be reported solely utilizing eCQMs. Another commenter stated their belief that quality measure reporting in an MVP should be available using a combination of claims-based reporting and eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eCQMs to discuss revisions for possible implementation in futures years.

Comment: One commenter encouraged retaining IA_EPA_1 in MIPS and this MVP for at least one additional year given its wide use across multiple specialties, so practices have a greater duration of time to review all improvement activities to identify and plan for more meaningful activities for the 2026 performance year.

Response: We appreciate the commenter’s feedback. Upon careful consideration, we are proceeding with removal of this activity under removal factor seven, activity is obsolete: this activity was created, in part, to incentivize utilization of EHRs to increase access to clinicians in off hours and decrease emergency room (ER) visits. Today, EHRs are highly utilized, and this activity has become standard of care.

Comment: One commenter suggested that, if we do not remove the TPCC measure from MIPS, then we should at a minimum remove the TPCC measure from all MVPs that include episode-based cost measures.

Response: The Total Per Capita Cost (TPCC) measure is appropriate for use in this MVP. We refer readers to the CY 2022 PFS proposed rule (86 FR 39881 through 39895), CY 2022 PFS final rule (86 FR 66001), CY 2023 PFS proposed rule (87 FR 46814 through 46828), and CY 2023 PFS final rule (87 FR 70038) for more information about why it is appropriate to include the TPCC measure in MVPs. We may consider the addition or removal of cost measures through future MVP maintenance and rulemaking processes. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

After consideration of public comments, we are finalizing the *Advancing Rheumatology Patient Care MVP* with modifications in Table B.4a and as proposed in Table B.4b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details.

B.5: Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP

In the CY 2025 PFS proposed rule (89 FR 26219 through 62622), we proposed and solicited comments on the previously finalized Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP. Tables B.5a and B.5b represent the measures and activities that were finalized within the Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP in ((88 FR 80039 through 80041) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.5b.

Quality Measures

We proposed to modify the previously finalized Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP to include one additional broadly applicable MIPS quality measure relevant to patients receiving stroke care and their experience of their health care treatment journey. We reviewed the MIPS quality measure inventory and considered feedback received during the 2025 MVP maintenance period to determine which quality measures to include in this MVP.

- **Q495: Ambulatory Palliative Care Patients' Experience of Feeling Heard and Understood:** This MIPS quality measure ensures palliative care clinicians and/or teams empathize to ensure patients are understood in a significant and empowering way.

We also proposed to modify the previously finalized Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP to remove one MIPS quality measure as this measure is proposed for removal from MIPS:

- Q409: Clinical Outcome Post Endovascular Stroke Treatment

We proposed to modify the Q344: Rate of Carotid Artery Stenting (CAS) for Asymptomatic Patients, Without Major Complications (Discharged to Home by Post-Operative Day #2) quality measure, which includes a proposed measure title update. Please see Appendix 1: MIPS Quality Measures, Table Group D of this final rule for all finalized revisions to this measure.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁵³, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; remove the weights associated with the improvement activities contained in this MVP; and remove one improvement activity being proposed for removal from MIPS:

- IA_CC_2: Implementation of improvements that contribute to more timely communication of test results

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP Tables

Tables B.5a and B.5b serve to represent the measures and activities that are finalized within the Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP.

Symbol Key:

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP. One commenter supported the inclusion of IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols improvement activity in this MVP. Another commenter supported the inclusion of the Q495: Ambulatory Palliative Care Patients’ Experience of Feeling Heard and Understood measure in this MVP.

Response: We thank the commenters for their support.

Comment: One commenter recommended this MVP include at least six eCQMs. One commenter is concerned that the MVP cannot be reported solely utilizing eCQMs. Another commenter stated their belief that quality measure reporting in an MVP should be available using a combination of claims-based reporting and eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eCQMs to discuss revisions for possible implementation in futures years.

After consideration of public comments, we are finalizing the *Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP* with modifications in Table B.5a and as proposed in Table B.5b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details. Based on comments received, we are delaying the removal of IA_CC_2: Implementation of improvements that contribute to more timely communication of test results. See Appendix 2, Table C for additional details.

B.6: Focusing on Women’s Health MVP

In the CY 2025 PFS proposed rule (89 FR 62622 through 62625), we proposed and solicited comments on the previously finalized Focusing on Women’s Health MVP. Tables B.6a and B.6b represent the measures and activities that were finalized within the Focusing on Women’s Health MVP in (88 FR 79981 through 79986) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.6b.

Quality Measures

We proposed to modify the previously finalized Focusing on Women’s Health MVP within the quality performance category of this MVP to include one additional MIPS quality measure that is relevant to women’s health. We reviewed the MIPS quality measure inventory and considered feedback received during the 2025 MVP maintenance period to determine which quality measures to include in this MVP.

The following quality measure proposed within this MVP provides a meaningful and comprehensive assessment of the clinical care for clinicians providing women’s health care to patients:

- **Q039: Screening for Osteoporosis for Women Aged 65-85 Years of Age:** This MIPS quality measure assesses women who have ever received a dual-energy x-ray absorptiometry (DXA) test to evaluate for the disease osteoporosis.

We are also proposing to modify the previously finalized Focusing on Women’s Health MVP to remove one MIPS quality measure as it is a process measure that has become standard of care, based on MIPS performance data as demonstrated by the measure’s high performance in the PY2024 MIPS Historical Quality Benchmarks file, as well as previous year’s benchmark data, and is being proposed for removal from MIPS:

- **Q472: Appropriate Use of DXA Scans in Women Under 65 Years Who Do Not Meet the Risk Factor Profile for Osteoporotic Fracture**

We proposed to modify the Q432: Proportion of Patients Sustaining a Bladder Injury at the Time of any Pelvic Organ Prolapse Repair quality measure, which includes a proposed measure title update. Please see Appendix 1: MIPS Quality Measures, Table Group D of this final rule for all finalized revisions to this measure.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁵⁴, we proposed the following: add the modified proposed IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; and remove the weights associated with the improvement activities contained in this MVP.

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Focusing on Women’s Health MVP Tables

Tables B.6a and B.6b serve to represent the measures and activities that are finalized within the Focusing on Women’s Health MVP.

Symbol Key:

- Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures

The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for this MVP. One commenter supported the inclusion of Q493: Adult Immunization Status measure in MVPs with a broad clinical reach such as this MVP. And another commenter supported the inclusion of IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols improvement activity in this MVP. One commenter suggested the addition of the Improving Practice Capacity for Human Immunodeficiency Virus (HIV) Prevention Services improvement activity to this MVP.

Response: We thank the commenters for their support. We may consider the inclusion of additional improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter expressed continued opposition to this MVP and recommended an MVP be developed that focused on gynecologic health and maternity care separately with the input of specialty societies.

Response: The MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting which would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician’s scope of care. We understand that not all quality measures are applicable to all clinicians who would choose to report this MVP; however, this represents the foundation from which to build the most meaningful MVP addressing women’s health and allows for clinician choice in choosing quality measures that best represent their practice.

After consideration of public comments, we are finalizing the *Focusing on Women’s Health MVP* with modifications in Table B.6a and as proposed in Table B.6b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details.

B.7: Improving Care for Lower Extremity Joint Repair MVP

In the CY 2025 PFS proposed rule (89 FR 62626 through 62628), we proposed and solicited comments on the previously finalized Improving Care for Lower Extremity Joint Repair MVP. Tables B.7a and B.7b represent the measures and activities that were finalized within the Advancing Improving Care for Lower Extremity Joint Repair MVP in (88 FR 80033 through 80035) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.7b.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁵⁵, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; and add an additional improvement activity that addresses maintenance requests from the public, as well as addresses priority areas including food insecurity and the incorporation of patient voices into health care decision making:

- IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols

In addition, we proposed the following: remove the weights associated with the improvement activities contained in this MVP; and remove one improvement activity being proposed for removal from MIPS:

- IA_PSPA_27: Invasive Procedure or Surgery Anticoagulation Medication Management

Improving Care for Lower Extremity Joint Repair MVP Tables

Tables B.7a and B.7b serve to represent the measures and activities that are finalized within the Improving Care for Lower Extremity Joint Repair MVP.

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP. One commenter expressed support for the modifications proposed to this MVP. Another commenter supported the addition of the Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols improvement activity in this MVP.

Response: We thank the commenters for their support.

Comment: One commenter recommended this MVP include at least six eCQMs. One commenter is concerned that the MVP cannot be reported solely utilizing eCQMs. Another commenter stated their belief that quality measure reporting in an MVP should be available using a combination of claims-based reporting and eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eCQMs to discuss revisions for possible implementation in futures years.

After consideration of public comments, we are finalizing the *Improving Care for Lower Extremity Joint Repair MVP* as proposed in Tables B.7a and B.7b for the CY 2025 performance period/2027 MIPS payment year and future years.

B.8: Optimal Care for Kidney Health MVP

In the CY 2025 PFS proposed rule (89 FR 62628 through 62631), we proposed and solicited comments on the previously finalized Optimal Care for Kidney Health MVP. Tables B.8a and B.8b represent the measures and activities that were finalized within the Optimal Care for Kidney Health MVP in (88 FR 80012 through 80015) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.8b.

Quality Measures

We proposed to modify the previously finalized Optimal Care for Kidney Health MVP within the quality performance category of this MVP to include three additional broadly applicable MIPS quality measures that are relevant to patients receiving care for kidney health. We reviewed the quality measure inventory and considered feedback received during the 2025 MVP maintenance period to determine which quality measures to include in this MVP.

- **Q495: Ambulatory Palliative Care Patients' Experience of Feeling Heard and Understood**: This MIPS quality measure ensures palliative care clinicians and/or teams empathize to ensure patients are understood in a significant and empowering way.
- **Q510: First Year Standardized Waitlist Ratio (FYSWR)**: This MIPS quality measure measures number of incident (newly initiated on dialysis) patients in a practitioner (inclusive of physicians and advanced practice providers) groups who were listed on the kidney or kidney-pancreas transplant waitlist or received a living donor transplant within the first year of initiating dialysis.
- **Q511: Percentage of Prevalent Patients Waitlisted (PPPW) and Percentage of Prevalent Patients Waitlisted in Active Status (aPPPW)**: This MIPS quality measure tracks dialysis patients who at a practitioner group practice who were on the kidney or kidney-pancreas transplant waitlist (all patients or patients in active status).

We proposed to modify the Q001: Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%) quality measure, which includes a proposed measure title update. Please see Appendix 1: MIPS Quality Measures, Table Group D of this final rule for all finalized revisions to this measure.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁵⁶, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; remove the weights associated with the improvement activities contained in this MVP; and remove one improvement activity being proposed for removal from MIPS:

- **IA_CC_2**: Implementation of improvements that contribute to more timely communication of test results

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Cost Measures

We proposed to add three MIPS cost measures within the cost performance category of this MVP, which apply to the clinical topic of kidney health. We reviewed the MIPS cost measure inventory and considered feedback received from interested parties through the MVP maintenance process to determine the cost measures to include in this MVP. The following proposed new cost measures provide a meaningful assessment of the clinical care for clinicians who specialize in kidney care and align with the other measures and activities included within this MVP and are described in section IV.A.4.e(2)(a)(ii) of this final rule:

- **Chronic Kidney Disease (CKD)**: This proposed MIPS episode-based cost measure will assess costs associated with medical care to manage and treat stage 4 or 5 chronic kidney disease.
- **End-Stage Renal Disease (ESRD)**: This proposed MIPS episode-based cost measure will assess costs associated with medical care to manage ESRD.
- **Kidney Transplant Management**: This proposed MIPS episode-based cost measure will assess costs associated with medical care related to kidney transplant, beginning no sooner than 90 days post-transplant.

Optimal Care for Kidney Health MVP Tables

Tables B.8a and B.8b serve to represent the measures and activities that are finalized within the Optimal Care for Kidney Health MVP.

Symbol Key:

Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures

Caret symbol (^): new proposed measures and improvement activities

Single asterisk (*): existing measures and improvement activities with revisions

Double asterisk (**): measures and improvement activities only available when included in an MVP

Single exclamation point (!): high priority measures

Double exclamation point (!!): outcome measures

Tilde (~): measures and improvement activities that include a health equity component

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for the modifications made to this MVP. A couple of commenters recommended the addition of Remote Monitoring [remote physiological monitoring (RPM) and remote therapeutic monitoring (RTM)]. One commenter expressed support for the inclusion of the First Year Standardized Waitlist Ratio measure or the Percentage of Prevalent Patients Waitlisted (PPPW) and Percentage of Prevalent Patients Waitlisted (PPPW) Percentage of Prevalent Patients Waitlisted in Active Status (aPPPW) measure in this MVP.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter did not support the inclusion of the First Year Standardized Waitlist Ratio measure or the Percentage of Prevalent Patients Waitlisted (PPPW) and Percentage of Prevalent Patients Waitlisted (PPPW) Percentage of Prevalent Patients Waitlisted in Active Status (aPPPW) measure as they feel these measures are largely outside of nephrologists’ ability to influence.

Response: The MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting which would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician’s scope of care. We understand that not all quality measures are applicable to all clinicians who would choose to report this MVP; however, this represents the foundation from which to build the most meaningful MVP addressing kidney health and allows for clinician choice in choosing quality measures that best represent their practice.

Comment: One commenter recommended this MVP include at least six eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to

reach out to the measure steward of current measures not available as eQMs to discuss revisions for possible implementation in future years.

Comment: One commenter suggested that, if we do not remove the TPCC measure from MIPS, then we should at a minimum remove the TPCC measure from all MVPs that include episode-based cost measures.

Response: The Total Per Capita Cost (TPCC) measure is appropriate for use in this MVP. We refer readers to the CY 2022 PFS proposed rule (86 FR 39881 through 39895), CY 2022 PFS final rule (86 FR 66001), CY 2023 PFS proposed rule (87 FR 46814 through 46828), and CY 2023 PFS final rule (87 FR 70038) for more information about why it is appropriate to include the TPCC measure in MVPs. We may consider the addition or removal of cost measures through future MVP maintenance and rulemaking processes. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

After consideration of public comments, we are finalizing the *Optimal Care for Kidney Health MVP* with modifications in Table B.8a and as proposed in Table B.8b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details. Based on comments received, we are delaying the removal of IA_CC_2: Implementation of improvements that contribute to more timely communication of test results. See Appendix 2, Table C for additional details.

B.9: Patient Safety and Support of Positive Experiences with Anesthesia MVP

In the CY 2025 PFS proposed rule (89 FR 62631 through 62633), we proposed and solicited comments on the previously finalized Patient Safety and Support of Positive Experiences with Anesthesia MVP. Tables B.9a and B.9b represent the measures and activities that were finalized within Patient Safety and Support of Positive Experiences with Anesthesia MVP in (88 FR 80036 through 80038) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.9b.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁵⁷, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; remove the weights associated with the improvement activities contained in this MVP; and remove two improvement activities being proposed for removal from MIPS:

- IA_CC_2: Implementation of improvements that contribute to more timely communication of test results
- IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record

Patient Safety and Support of Positive Experiences with Anesthesia MVP Tables

Tables B.9a and B.9b serve to represent the measures and activities that are finalized within the Patient Safety and Support of Positive Experiences with Anesthesia MVP.

Symbol Key:

Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures

Single asterisk (*): existing measures and improvement activities with revisions

Double asterisk (**): measures and improvement activities only available when included in an MVP

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP. One commenter appreciates our effort in ensuring nurse practitioners (NPs) are eligible to participate in all the currently developed MVPs. Another commenter expressed support for all proposed changes to the improvement activity performance category in this MVP. Several commenters specifically supported the removal of the improvement activity weights from all activities and the updated requirement for MVP reporting requiring attestation to only one improvement activity. One commenter supported the inclusion of Q487: Screening for Social Drivers of Health improvement activity in this MVP.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter recommended this MVP include at least six eCQMs. One commenter is concerned that the MVP cannot be reported solely utilizing eCQMs. Another commenter stated their belief that quality measure reporting in an MVP should be available using a combination of claims-based reporting and eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eCQMs to discuss revisions for possible implementation in future years.

After consideration of public comments, we are finalizing the *Patient Safety and Support of Positive Experiences with Anesthesia MVP* with modifications in Table B.9a and as proposed in Table B.9b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the removal of IA_CC_2: Implementation of improvements that contribute to more timely communication of test results. See Appendix 2, Table C for additional details.

B.10: Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP

In the CY 2025 PFS proposed rule (89 FR 62633 through 62636), we proposed and solicited comments on the previously finalized Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP. Tables B.10a and B.10b represent the measures and activities that were finalized within the Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP in (88 FR 79991 through 79995) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.10b.

Quality Measures

We did not propose to modify the previously finalized Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP within the quality performance category of this MVP by proposing to add or remove quality measures from the MVP. However, we proposed to modify the Q340: HIV Medical Visit Frequency quality measure, which includes a proposed measure title update to HIV Annual Retention in Care. Please see Appendix 1: MIPS Quality Measures, Table Group D of this final rule for all finalized revisions to this measure.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁵⁸, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; remove the weights associated with the improvement activities contained in this MVP; and remove one improvement activity being proposed for removal from MIPS:

- IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups who Have Real-Time Access to Patient's Medical Record

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP Tables

Tables B.10a and B.10b serve to represent the measures and activities that are finalized within the Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP.

Symbol Key:

- Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP. One commenter supported the inclusion of Improving Practice Capacity for Human Immunodeficiency Virus (HIV) Prevention Services IA in this MVP. One commenter supported the inclusion of Q493: Adult Immunization Status measure in MVPs with a broad clinical reach such as this MVP.

Response: We thank the commenters for their support.

Comment: One commenter continued to oppose the inclusion of the Total Per Capita Cost (TPCC) measure in this MVP. The commenter believed this measure captures aspects of care that infectious disease physicians do not have direct control over, and it provides little meaningful or actionable data to help clinicians understand what they can do to lower costs and improve the value of care. Importantly, for their specialty, is the failure of the measure to account for short-term investments that might result in savings and higher-quality care over the long term. One commenter suggested that, if we do not remove the TPCC measure from MIPS, then we should at a minimum remove the TPCC measure from all MVPs that include episode-based cost measures.

Response: The Total Per Capita Cost (TPCC) measure is appropriate for use in this MVP. We refer readers to the CY 2022 PFS proposed rule (86 FR 39881 through 39895), CY 2022 PFS final rule (86 FR 66001), CY 2023 PFS proposed rule (87 FR 46814 through 46828), and CY 2023 PFS final rule (87 FR 70038) for more information about why it is appropriate to include the TPCC measure in MVPs. We may consider the addition or removal of cost measures through future MVP maintenance and rulemaking processes. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

After consideration of public comments, we are finalizing the *Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP* with modifications in Table B.10a and as proposed in Table B.10b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details.

B.11: Quality Care for Patients with Neurological Conditions MVP

In the CY 2025 PFS proposed rule (89 FR 62636 through 62639), we proposed and solicited comments on the previously finalized Optimal Care for Patients with Episodic Neurological Conditions and the Supportive Care for Neurodegenerative Conditions MVPs proposal to consolidate the two MVPs into a single consolidated neurological MVP titled Quality Care for Patients with Neurological Conditions. Tables B.11a and B.11b represent the measures and activities that were finalized within the Optimal Care for Patients with Episodic Neurological Conditions MVP (88 FR 80015 through 80018) and the Supportive Care for Neurodegenerative Conditions MVP (88 FR 80019 through 80021) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.11b.

Quality Measures

We proposed to modify the previously finalized neurology MVPs within the quality performance category of this MVP to include two additional broadly applicable MIPS quality measures relevant to patients receiving care for neurodegenerative disorders. We reviewed the MIPS quality measure inventory and considered feedback received during the 2024 MVP maintenance period to determine which quality measures to include in this MVP.

- Q155: Falls: Plan of care: This MIPS quality measure ensures adult patients, with a history of falls, have a plan of care for falls.

- **Q495: Ambulatory Palliative Care Patients’ Experience of Feeling Heard and Understood:** This MIPS quality measure ensures palliative care clinicians and/or teams empathize to ensure patients are understood in a significant and empowering way.

We proposed to modify the previously finalized MVPs to remove six QCDR measures no longer being supported by Axon Registry QCDR:

- AAN5: Treatment Prescribed for Acute Migraine Attack
- AAN9: Querying and Follow-Up About Symptoms of Autonomic Dysfunction for Patients with Parkinson’s Disease
- AAN22: Quality of Life Outcome for Patients with Neurologic Conditions
- AAN31: Acute Treatment Prescribed for Cluster Headache
- AAN32: Preventive Treatment Prescribed for Cluster Headache
- AAN34: Patient reported falls and plan of care

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁵⁹, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; remove the weights associated with the improvement activities contained in this MVP; and remove three improvement activities being proposed for removal from MIPS:

- IA_BMH_8: Electronic Health Record Enhancements for BH data capture
- IA_CC_1: Implementation of Use of Specialist Reports Back to Referring Clinician or Group to Close Referral Loop
- IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient’s Medical Record

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Quality Care for Patients with Neurological Conditions MVP Tables

Tables B.11a and B.11b serve to represent the measures and activities that are finalized within the Quality Care for Patients with Neurological Conditions MVP.

Symbol Key:

- Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures
- Single asterisk (*): existing measures and improvement activities with revisions
- Double asterisk (**): measures and improvement activities only available when included in an MVP
- Single exclamation point (!): high priority measures
- Double exclamation point (!!): outcome measures
- Tilde (~): measures and improvement activities that include a health equity component

The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for the consolidation of the Optimal Care for Patients with Episodic Neurological Conditions and Supportive Care for Neurodegenerative Conditions MVPs. One commenter supported the inclusion of the Q495: Ambulatory Palliative Care Patients' Experience of Feeling Heard and Understood measure in this MVP. One commenter recommended the addition of Q182: Functional Outcome Assessment in this MVP. The commenter believed this measure would provide a broader functional status measure with flexibility for selecting standardized PROM tools, allowing clinicians evaluating patients with a broad range of neurological conditions, including rare diseases such as myasthenia gravis, to evaluate functionality and be measured under MIPS. A couple of commenters recommended additional eCQM collection types for Quality measures in this MVP.

Response: We may consider the inclusion of additional quality measures through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP. Please note that all collection types for each MIPS quality measure finalized through rulemaking will be available for use within the MVP.

Comment: One commenter believed the current iteration of Quality Care for Patients with Neurological Conditions MVP does not meet its intended purpose of serving as a transition from MIPS into value-based care. The commenter appreciated the development of the current comprehensive MVPs but encouraged further development of quality and cost measures as well as care delivery models that are targeted and condition specific, while also serving as a meaningful on-ramp into participating in APMs.

Response: This MVP has a broad clinical focus and captures performance driving positive clinical outcomes by providing fundamental treatment and management of patients with neurological conditions. As we work through the transition from traditional MIPS to MVPs, we anticipate MIPS eligible clinicians/groups will continue to utilize traditional MIPS in the absence of an appropriate and applicable MVP; however, by utilizing reporting trends and focusing on more specialty-specific quality measures, the MVP works to capture more meaningful data to the clinician's scope of care. Moreover, it would not be expected for every aspect of a clinician's scope of care to be assessed, as the clinician would have choice in which quality measures, they find most meaningful and appropriate for their case-mix and practice. The intent is to provide clinicians flexibility and choice in reporting by allowing them to select a subset of measures and activities within an MVP based upon a clinical topic. We would encourage the commenter to submit quality measures to the Annual Call for Quality Measures for potential inclusion in future years. As MVPs continue from year to year, the MVP Maintenance Process can be utilized to update MVPs to ensure they represent priorities in care for the MVP topic and align with care being delivered by the clinicians reporting.

Comment: One commenter recommended this MVP include at least six eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to

reach out to the measure steward of current measures not available as eQMs to discuss revisions for possible implementation in future years.

After consideration of public comments, we are finalizing the *Quality Care for Patients with Neurological Conditions MVP* with modifications in Table B.11a and as proposed in Table B.11b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details. Based on comments received, we are delaying the removal of IA_BMH_8: Electronic Health Record Enhancements for BH data capture and IA_CC_1: Implementation of Use of Specialist Reports Back to Referring Clinician or Group to Close Referral Loop. See Appendix 2, Table C for additional details.

B.12: Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP

In the CY 2025 PFS proposed rule (89 FR 62639 through 62641), we proposed and solicited comments on the previously finalized Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP. Tables B.12a and B.12b represent the measures and activities that were finalized within the Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP in (88 FR 79986 through 79990) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.12b.

Quality Measures

We proposed to modify the previously finalized Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP within the quality performance category of this MVP to remove two QCDR measures whose quality actions reflect a standard of care based upon clinical guidelines recognized as best practices by health care clinicians. Based upon MIPS performance data, AAO16 is high performing and AAO23 has had minimal variation in its historical benchmark. Though allergic rhinitis falls within the spectrum of care otolaryngologists provide, the complexity of caring for the condition is typically low. Many non-surgical clinician specialties, including primary care, treat allergic rhinitis regularly. Further, measure AAO23 requires the use of medications that all are available over the counter. Removal of AAO23 will encourage use of other measures within the MVP that represent the complexity of care otolaryngologists provide.

- AAO16: Age-Related Hearing Loss: Audiometric Evaluation
- AAO23: Allergic Rhinitis: Intranasal Corticosteroids or Oral Antihistamines

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁶⁰, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; remove the weights associated with the improvement activities contained in this MVP; and remove two improvement activities being proposed for removal from MIPS:

- IA_CC_1: Implementation of Use of Specialist Reports Back to Referring Clinician or Group to Close Referral Loop
- IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP Tables

Tables B.12a and B.12b serve to represent the measures and activities that are finalized within the Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP.

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP.

Response: We thank the commenters for their support.

Comment: One commenter recommended this MVP include at least six eCQMs. One commenter is concerned that the MVP cannot be reported solely utilizing eCQMs. Another commenter stated their belief that quality measure reporting in an MVP should be available using a combination of claims-based reporting and eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eCQMs to discuss revisions for possible implementation in future years.

Comment: One commenter is opposed to the removal of IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record, AAO16: Age-Related Hearing Loss: Audiometric Evaluation, and AAO23: Allergic Rhinitis: Intranasal Corticosteroids or Oral Antihistamines. The commenter believed that the removal of the quality measures would eliminate nearly one quarter of the specialty-specific quality measures within the MVP, which could significantly affect the ability of otolaryngologists to participate in the MVP decreasing the opportunity to effectively evaluate and improve care for patients.

Response: Upon careful consideration, we are proceeding with removal of IA_EPA_1 under removal factor seven, activity is obsolete: this activity was created, in part, to incentivize utilization of EHRs to increase access to clinicians in off hours and decrease emergency room (ER) visits. Today, EHRs are highly utilized, and this activity has become standard of care.

We appreciate commenters' feedback on AAO16 and AAO23. Based upon MIPS performance data, AAO16 is high performing and AAO23 has had minimal variation in its historical benchmark. Though allergic rhinitis falls within the spectrum of care

otolaryngologists provide, the complexity of caring for the condition is typically low. Many non-surgical clinician specialties, including primary care, treat allergic rhinitis regularly.

After consideration of public comments, we are finalizing the *Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP* with modifications in Table B.12a and as proposed in Table B.12b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details. Based on comments received, we are delaying the removal of IA_CC_1: Implementation of Use of Specialist Reports Back to Referring Clinician or Group to Close Referral Loop. See Appendix 2, Table C for additional details.

B.13: Quality Care in Mental Health and Substance Use Disorders MVP

In the CY 2025 PFS proposed rule (89 FR 62641 through 62643), we proposed and solicited comments on the previously finalized Quality Care in Mental Health and Substance Use Disorders MVP. Tables B.13a and B.13b represent the measures and activities that were finalized within the Quality Care in Mental Health and Substance Use Disorders MVP in (88 FR 79986 through 80001) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.13b.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁶¹, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; and remove the weights associated with the improvement activities contained in this MVP.

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP. One commenter supported the inclusion of IA_ERP_6: COVID-19 Vaccine Achievement for Practice Staff activity to this MVP. One commenter appreciated the continuation of Q468: Continuity of Pharmacotherapy for Opioid Use Disorder (OUD) in this MVP. One commenter recommended the addition of Q493: Adult Immunization Status and other potentially relevant vaccination measures into this MVP.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter believed the data reportable for many of the measures in this MVP are not clinically meaningful for much of the treated patient population and are not tracked for clinicians.

Response: The MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting which would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician’s scope of care. We understand that not all measures are applicable to all clinicians who would choose to report this MVP. However, this represents the foundation from which to build the most meaningful MVP addressing mental health and substance use disorder care and allows for clinician choice in choosing quality measures that best represent their practice.

After consideration of public comments, we are finalizing the *Quality Care in Mental Health and Substance Use Disorders MVP* as proposed in Tables B.13a and B.13b for the CY 2025 performance period/2027 MIPS payment year and future years.

B.14: Rehabilitative Support for Musculoskeletal Care MVP

In the CY 2025 PFS proposed rule (89 FR 62643 through 62646), we proposed and solicited comments on the previously finalized Rehabilitative Support for Musculoskeletal Care MVP. Tables B.14a and B.14b represent the measures and activities that were finalized within the Rehabilitative Support for Musculoskeletal Care MVP in (88 FR 80002 through 80007) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.14b.

Quality Measures

We proposed to modify the previously finalized Rehabilitative Support for Musculoskeletal Care MVP within the quality performance category of this MVP to include one additional MIPS quality measure and four QCDR measures that are relevant to patients receiving rehabilitative support for Musculoskeletal Care. We reviewed the MIPS quality measure inventory and considered feedback received during the 2024 MVP maintenance period to determine which quality measures to include in this MVP.

- **Q050: Urinary Incontinence: Plan of Care for Urinary Incontinence in Women Aged 65 Years and Older:** This MIPS quality measure ensures that female patients with a diagnosis of urinary incontinence have a documented plan of care regarding rehabilitative treatment for urinary incontinence at least once within 12 months. A rehabilitation plan of care for these patients will address the musculoskeletal impairments of the pelvic floor related to urinary incontinence in women.
- **MSK6: Patients Suffering From a Neck Injury who Improve Pain:** This QCDR measure evaluates patients with a neck injury for achieving the minimal clinically important difference (MCID) improvement in pain by the end of treatment.
- **MSK7: Patients Suffering From an Upper Extremity Injury who Improve Pain:** This QCDR measure evaluates patients with an upper extremity injury for achieving the minimal clinically important difference (MCID) improvement in pain by the end of treatment.
- **MSK8: Patients Suffering From a Back Injury who Improve Pain:** This QCDR measure evaluates patients with a back injury for achieving the minimal clinically important difference (MCID) improvement in pain by the end of treatment.
- **MSK9: Patients Suffering From a Lower Extremity Injury who Improve Pain:** This QCDR measure evaluates patients with a lower extremity injury for achieving the minimal clinically important difference (MCID) improvement in pain by the end of treatment.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁶², we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; remove the weights associated with the improvement activities contained in this MVP; and remove two improvement activities being proposed for removal from MIPS:

- IA_CC_1: Implementation of Use of Specialist Reports Back to Referring Clinician or Group to Close Referral Loop
- IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record

Rehabilitative Support for Musculoskeletal Care MVP Tables

Tables B.14a and B.14b serve to represent the measures and activities that are finalized within the Rehabilitative Support for Musculoskeletal Care MVP.

Symbol Key:

- Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures
- Single asterisk (*): existing measures and improvement activities with revisions
- Double asterisk (**): measures and improvement activities only available when included in an MVP
- Single exclamation point (!): high priority measures
- Double exclamation point (!!): outcome measures
- Tilde (~): measures and improvement activities that include a health equity component

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for the proposed modifications of the Rehabilitative Support for this MVP. A few commenters supported the addition of MSK6: Patients Suffering From a Neck Injury who Improve Pain, MSK7: Patients Suffering From an Upper Extremity Injury who Improve Pain, MSK8: Patients Suffering From a Back Injury who Improve Pain, and MSK9: Patients Suffering From a Lower Extremity Injury who Improve Pain to this MVP. One commenter supported the addition of Q050: Urinary Incontinence: Plan of Care for Urinary Incontinence in Women Aged 65 Years and Older. Another commenter supported the inclusion of IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols in this MVP. Several commenters supported the removal of the improvement activity weights from all activities and the updated requirement for MVP reporting requiring attestation to only one improvement activity.

Response: We thank the commenters for their support.

Comment: Several commenters expressed concern with the limited nature of what can be reported in this MVP. The proposed measures to be added are pain measures, not functional measures; MSK6: Patients Suffering From a Neck Injury who Improve Pain, MSK7: Patients Suffering From an Upper Extremity Injury who Improve Pain, MSK8: Patients Suffering From a Back Injury who Improve Pain, and MSK9: Patients Suffering From a Lower Extremity Injury who Improve Pain. The commenters believed that the measures provide a poor measure of value for outpatient physical and occupational therapy clinicians.

Response: The MVPs are intentionally broad to allow for comprehensive reporting within the MVP topic and contain measures that represent different aspects of care. Rather than create an MVP for each subspecialty and/or setting that would create an overly complex MVP inventory state and increase administrative burden, these nuances may be captured within the MVP through different measures and activities representative of the reporting clinician’s scope of care. We understand that not all measures are applicable to all clinicians who would choose to report this MVP. However, this represents the foundation from which to build the most meaningful MVP addressing rehabilitative support for musculoskeletal care and allows for clinician choice in choosing quality measures that best represent their practice. Specifically, in addition to the MSK pain measures, this MVP does include seven MIPS CQMs that assess patient function and are applicable to most physical and occupational therapists. We understand that not all quality measures are applicable to all clinicians who would choose to report this MVP; however, this represents the foundation from which to build the most meaningful MVP addressing Rehabilitative Support for Musculoskeletal Care and allows for clinician choice in choosing quality measures that best represent their practice.

Comment: One commenter recommended adding functional measures to this MVP. A few commenters specifically requested the addition of MSK01: Patients Suffering From a Neck Injury who Improve Physical Function, MSK02: Patients Suffering From an Upper Extremity Injury who Improve Physical Function, MSK03: Patients Suffering From a Back Injury who Improve Physical Function, MSK04: Patients Suffering From a Lower Extremity Injury who Improve Physical Function, MSK05: Patients Suffering From a Knee Injury who Improve Physical Function and MSK10: Patients Suffering From a Knee Injury who Improve Pain. The commenter believed these measures would strengthen the MVP's ability to assess and report on quality in musculoskeletal rehabilitation and drive increased participation in the MVP and Quality Payment Programs.

Response: We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: A couple of commenters stated their belief that the current functional measures (FOTO measures Q217: Functional Status Change for Patients with Knee Impairments, Q218: Functional Status Change for Patients with Hip Impairments, Q219: Functional Status Change with Lower Leg, Foot or Ankle Impairments, Q220: Functional Status Change for Patients with Low Back Impairments, Q221: Functional Status Change for Patients with Shoulder Impairments, Q222: Functional Status Change for Patients with Elbow, Wrist or Hand Impairments, and Q478: Functional Status Change for Patients with Neck Impairments) included in the MVP do not allow participation in the program with use of the PROMIS measures and are burdensome to collect and report if the therapist prefers to use the industry standard outcome measure tools. They asserted that this causes an additional burden on the clinician due to the absence of interoperability available for the FOTO measures to be integrated into other digital applications. One commenter recommended this MVP be expanded to include the complete MSK measure set.

Another commenter recommended the addition of several additional quality measures that would promote meaningful participation for physical therapists and other nonphysicians: Q182: Functional Outcome Assessment, Q134: Preventive Care and Screening: Screening for Depression and Follow-Up Plan, Q226: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention), and Q431: Preventive Care and Screening: Unhealthy Alcohol Use: Screening & Brief Counseling. One commenter requested the inclusion of several additional improvement activities: IA_BE_15: Engagement of patients, family and caregivers in developing a plan of care, IA_BE_16: Promote Self-management in Usual Care, IA_CC_9: Implementation of practices/processes for developing regular individual care plans, and IA_PM_13: Chronic care and preventative care management for empaneled patients.

Response: We acknowledge the commenters' concerns; however, the MIPS CQMs within this MVP are currently implemented and reported in MIPS. Specifically, the FOTO measures do not have to be reported within an existing digital application. The tools are publicly available for clinician and patient use and allows for a cross walk to several industry standard legacy tools. We understand that not all quality measures are applicable to all clinicians who would choose to report this MVP; however, this represents the foundation from which to build the most meaningful MVP addressing Rehabilitative Support for Musculoskeletal Care and allows for clinician choice in choosing quality measures that best represent their scope of care. Currently, we endeavor to not create overlap in quality/QCDR measure concepts. We may consider the inclusion of additional quality measures through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will continue to evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP. Please note that all collection types for each MIPS quality measure finalized through rulemaking will be available for use within the MVP.

Comment: One commenter expressed concern with potential misalignment between the Low Back Pain cost measure and the quality measures included in this MVP. The commenter stated that most of the quality measures included in this MVP are not related to back pain and among the few that are, most lack a benchmark which means they are not being reported.

Response: We note that MIPS Q220: Functional Status Change for Patients with Low Back Impairments has a 2024 historical benchmark of 74.02% indicating that the measure is being reported and performance still indicates a gap. QCDR measure, MSK8: Patients Suffering From a Back Injury who Improve Pain is a new measure for the CY 2024 performance period, so would not yet have established a benchmark as reporting data would be submitted in early 2025. We maintain that the Low Back Pain episode-based cost measure is appropriate for use in this MVP, as described in the CY 2024 PFS proposed rule (88 FR 53164) and finalized in the CY 2024 PFS final rule (88 FR 80003 through 80007). We may consider the addition or removal of cost measures through future MVP maintenance and rulemaking processes. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter recommended this MVP include at least six eCQMs. One commenter is concerned that the MVP cannot be reported solely utilizing eCQMs. Another commenter stated their belief that quality measure reporting in an MVP should be available using a combination of claims-based reporting and eCQMs.

Response: We encourage the development of eCQMs as part of our overall strategy towards digital quality measures (dQMs); however, not all measures are submitted to the Call for Measures with an option for the eCQM collection type as this is not

currently a requirement for MIPS. We strive to include measures from different collection types to allow flexibility in reporting but are limited to how the measure is submitted by the measures steward to the Call for Measures. We encourage the commenter to reach out to the measure steward of current measures not available as eQMs to discuss revisions for possible implementation in future years.

After consideration of public comments, we are finalizing the *Rehabilitative Support for Musculoskeletal Care MVP* with modifications in Table B.14a and as proposed in Table B.14b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the removal of IA_CC_1: Implementation of Use of Specialist Reports Back to Referring Clinician or Group to Close Referral Loop. See Appendix 2, Table C for additional details.

B.15: Value in Primary Care MVP

In the CY 2025 PFS proposed rule (89 FR 62646 through 62648), we proposed and solicited comments on the previously finalized Value in Primary Care MVP. Tables B.15a and B.15b represent the measures and activities that were finalized within the Value in Primary Care MVP in (88 FR 80042 through 80047) with modifications proposed for the CY 2025 performance period/2027 MIPS payment year and future years. The summary of the public comments received and our responses for this MVP are included immediately after Table B.15b.

Quality Measures

We did not propose to modify the previously finalized Value in Primary Care MVP within the quality performance category of this MVP by proposing to add or remove quality measures from the MVP. However, we proposed to modify the Q001: Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%) quality measure, which includes a proposed measure title update to Diabetes: Glycemic Status Assessment Greater Than 9%. Please see Appendix 1: MIPS Quality Measures, Table Group D of this final rule for all finalized revisions to this measure.

Improvement Activities

For the reasons stated in the introduction of this appendix¹¹⁶³, we proposed the following: add the proposed modified IA_ERP_6 (modified to IA_PM_26) to all new and previously finalized MVPs because of the importance of vaccination status in practice settings; and add a proposed improvement activity that addresses risk for heart disease, the leading cause of death in the United States, as well as risk for stroke, which is the fifth most common cause of death. Promoting the implementation of standardized, evidence-based cardiovascular disease risk assessment and care management in the primary care setting has the potential to impact patient outcomes sizably and positively. This new activity, IA_PM_25, is based on the results of the CMS Innovation Center Million Hearts Model:

- IA_PM_25: Save a Million Hearts: Standardization of Approach to Screening and Treatment for Cardiovascular Disease Risk

In addition, we proposed the following: remove the weights associated with the improvement activities contained in this MVP; and remove two improvement activities being proposed for removal from MIPS:

- IA_CC_2: Implementation of improvements that contribute to more timely communication of test results
- IA_EPA_1: Provide 24/7 Access to MIPS Eligible Clinicians or Groups Who Have Real-Time Access to Patient's Medical Record

We proposed to modify the IA_BE_4: Engagement of patients through implementation of improvements in patient portal improvement activity, which included a proposed activity title update. Please see Appendix 2, Improvement Activities: Table Group B of this final rule for finalized revisions to this activity.

Value in Primary Care MVP Tables

Tables B.15a and B.15b serve to represent the measures and activities that are finalized within the Value in Primary Care MVP.

Symbol Key:

Plus sign (+): proposed additions of MIPS quality measures, improvement activities, or cost measures

Caret symbol (^): new proposed measures and improvement activities

Single asterisk (*): existing measures and improvement activities with revisions

Double asterisk (**): measures and improvement activities only available when included in an MVP

Single exclamation point (!): high priority measures

Double exclamation point (!!): outcome measures

Tilde (~): measures and improvement activities that include a health equity component

¹¹⁶³ See *MVP Development: Improvement Activity Policy Update and Global Inclusion of an Improvement Activity*.

The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for this MVP. One commenter appreciated the focus on screening in this MVP. One commenter agreed that the measures reflected in this MVP are consistent with the focus of the APCM service requirements and practice capabilities for advanced primary care. Another commenter supported the inclusion of Improving Practice Capacity for Human Immunodeficiency Virus (HIV) Prevention Services IA in this MVP. A couple of commenters supported the inclusion of Q493: Adult Immunization Status measure in this MVP. Another commenter supported the inclusion of IA_AHE_9: Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols in this MVP.

A couple of commenters recommended the addition of the following quality measures to this MVP as they provide additional collection types; Q112: Breast Cancer Screening, Q113: Colorectal Cancer Screening, Q128: Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow Up Plan, Q226: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention, Q309: Cervical Cancer Screening, Q238: Use of High-Risk Medications in Older Adults, Q472: Appropriate Use of DXA Scans in Women Under 65 Years Who Do Not Meet the Risk Factor Profile for Osteoporotic Fracture, and Q065: Appropriate Treatment for Upper Respiratory Infection (URI). One commenter urged us to consider the inclusion of the kidney health evaluation quality measure to promote screening and diagnosis of CKD for Medicare beneficiaries with diabetes in the primary care setting. One commenter recommended the inclusion of the new improvement activity for clinicians to assess and manage patients at risk of ASCVD. Another commenter recommended the addition of the proposed Implementation of Protocols and Provision of Resources to Increase Lung Cancer Screening Uptake activity in this MVP. One commenter recommended the addition of the Ambulatory Palliative Care Patients Experience of Feeling Heard and Understood measure in this MVP.

Response: We thank the commenters for their support. We may consider the inclusion of additional quality measures and improvement activities through the MVP Maintenance Process and future rulemaking. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

Comment: One commenter suggested that, if we do not remove the TPCC measure from MIPS, then we should at a minimum remove the TPCC measure from all MVPs that include episode-based cost measures.

Response: The Total Per Capita Cost (TPCC) measure is appropriate for use in this MVP. We refer readers to the CY 2022 PFS proposed rule (86 FR 39881 through 39895), CY 2022 PFS final rule (86 FR 66001), CY 2023 PFS proposed rule (87 FR 46814 through 46828), and CY 2023 PFS final rule (87 FR 70038) for more information about why it is appropriate to include the TPCC measure in MVPs. We may consider the addition or removal of cost measures through future MVP maintenance and rulemaking processes. Interested parties are welcome to submit recommended changes to an MVP on an ongoing basis. Guidance on how to submit recommended changes to an MVP can be found on the QPP website. We will evaluate the recommendations received and determine if they are appropriate and align with the broader vision for the MVP.

After consideration of public comments, we are finalizing the *Value in Primary Care MVP* with modifications in Table B.15a and as proposed in Table B.15b for the CY 2025 performance period/2027 MIPS payment year and future years. Based on comments received, we are delaying the proposed modification of IA_BE_4: Engagement of patients through implementation of improvements in patient portal. See Appendix 2, Table B for additional details. Based on comments received, we are delaying the removal of IA_CC_2: Implementation of improvements that contribute to more timely communication of test results. See Appendix 2, Table C for additional details.

[FR Doc. 2024–25382 Filed 11–1–24; 4:15 pm]

BILLING CODE 4120–01–C
