(5) *Description from petition:* Isooctyl alcohol is a branched alcohol used in applications such as surfactant.

Isooctyl alcohol is produced using propylene. Taxable chemicals constitute 68.10 percent by weight of the materials used to produce this substance.

(6) *Process identified in petition as predominant method of production of substance:* Isooctyl alcohol is produced in an oxonation reaction. Plasticizer alcohols, including isooctyl alcohol, are derived from the oxo reaction with branched olefins. Refinery-connected polygas units generate many of these olefins as purified cuts or fractions. For example, isooctyl alcohol is produced from heptene, which is an isomeric mixture of C7 olefins that are derived from the reaction of propylene and butylenes. The extent of branching in heptane depends on the reaction conditions and feedstock ratio at the polygas units. Since these conditions are variable, the specifications of the alcohol product may vary among producers.

The hydrogen used for these reactions are not produced from steam-methane reforming. The source of H₂ is from POx reactor, which feeds liquids, not methane. The POx process is an industrial process that converts hydrocarbons feeds into syngas (a combination of H₂ and CO gas). The hydrocarbon feed is in the liquid state. The unit feeds a variety of liquid hydrocarbons such as paraffins, olefins, and aromatics in the C5–C20 range, obtained from the refinery pipestills and other chemicals units.
